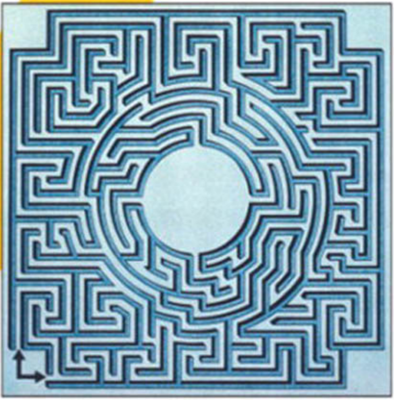
ADVANCED UNIX PROGRAMMING

Advanced UNIX® Programming

SECOND EDITION



MARC J. ROCHKIND

ADDISON-WESLEY PROFESSIONAL COMPUTING SERIES

Advanced UNIX Programming

Advanced UNIX Programming

Table of Contents

Contents

Preface

Chapter 1 Fundamental Concepts

- 1.1 A Whirlwind Tour of UNIX and Linux
- 1.2 Versions of UNIX
- 1.3 Using System Calls
- 1.4 Error Handling
- 1.5 UNIX Standards
- 1.6 Common Header File
- 1.7 Dates and Times
- 1.8 About the Example Code
- 1.9 Essential Resources

Chapter 2 Basic File I/O

- 2.1 Introduction to File I/O
- 2.2 File Descriptors and Open File Descriptions
- 2.3 Symbols for File Permission Bits
- 2.4 open and creat System Calls
- 2.5 umask System Call
- 2.6 unlink System Call
- 2.7 Creating Temporary
- 2.8 File Offsets and O_APPEND
- 2.9 write System Call
- 2.10 read System Call
- 2.11 close System Call

Table of Contents

2.12 User Buffered I/O

2.13 lseek System Call

2.14 pread and pwrite System Calls

2.15 readv and writev System Calls

2.16 Synchronized I/O

2.17 truncate and ftruncate System Calls

Chapter 3 Advanced File I/O

3.1 Introduction

3.2 Disk Special Files and File Systems

3.3 Hard and Symbolic Links

3.4 Pathnames

3.5 Accessing and Displaying File Metadata

3.6 Directories

3.7 Changing an I-Node

3.8 More File-Manipulation Calls

3.9 Asynchronous I/O

Chapter 4 Terminal I/O

4.1 Introduction

4.2 Reading from a Terminal

4.3 Sessions and Process Groups (Jobs)

4.4 ioctl System Call

4.5 Setting Terminal Attributes

4.6 Additional Terminal-Control System Calls

4.7 Terminal-Identification System Calls

4.8 Full-Screen Applications

4.9 STREAMS I/O

4.10 Pseudo Terminals

Chapter 5 Processes and Threads

Table of Contents

- 5.1 Introduction
- 5.2 Environment
- 5.3 exec System Calls
- 5.4 Implementing a Shell (Version 1)
- 5.5 fork System Call
- 5.6 Implementing a Shell (Version 2)
- 5.7 exit System Calls and Process Termination
- 5.8 wait, waitpid, and waitid System Calls
- 5.9 Signals, Termination, and Waiting
- 5.10 Implementing a Shell (Version 3)
- 5.11 Getting User and Group IDs
- 5.12 Setting User and Group IDs
- 5.13 Getting Process IDs
- 5.14 chroot System Call
- 5.15 Getting and Setting the Priority
- 5.16 Process Limits
- 5.17 Introduction to Threads
- 5.18 The Blocking Problem

Chapter 6 Basic Interprocess Communication

- 6.1 Introduction
- 6.2 Pipes
- 6.3 dup and dup2 System Calls
- 6.4 A Real Shell
- 6.5 Two-Way Communication with Unidirectional Pipes
- 6.6 Two-Way Communication with Bidirectional Pipes

Chapter 7 Advanced Interprocess Communication

- 7.1 Introduction
- 7.2 FIFOs, or Named Pipes

Table of Contents

7.3 An Abstract Simple Messaging Interface (SMI)

7.4 System V IPC (Interprocess Communication)

7.5 System V Message Queues

7.6. POSIX IPC

7.7 POSIX Message Queues

7.8 About Semaphores

7.9 System V Semaphores

7.10 POSIX Semaphores

7.11 File Locking

7.12 About Shared Memory

7.13 System V Shared Memory

7.14 POSIX Shared Memory

7.15 Performance Comparisons

Chapter 8 Networking and Sockets

8.1 Socket Basics

8.2 Socket Addresses

8.3 Socket Options

8.4 Simple Socket Interface (SSI)

8.5 Socket Implementation of SMI

8.6 Connectionless Sockets

8.7 Out-of-Band Data

8.8 Network Database Functions

8.9 Miscellaneous System Calls

8.10 High-Performance Considerations

Chapter 9 Signals and Timers

9.1 Signal Basics

9.2 Waiting for a Signal

9.3 Miscellaneous Signal System Calls

Table of Contents

- 9.4 Deprecated Signal System Calls
- 9.5 Realtime Signals Extension (RTS)
- 9.6 Global Jumps
- 9.7 Clocks and Timers

Appendix A: Process Attributes

Appendix B: Ux: A C++ Wrapper for Standard UNIX Functions

Appendix C: Jtux: A Java/Jython Interface to Standard UNIX Functions

Appendix D: Alphabetical and Categorical Function Lists
