About the Authors
1 SIGNALS AND SPECTRA
- 1.1 Digital Communication Signal Processing
  - 1.1.1 Why Digital?
  - 1.1.2 Typical Block Diagram and Transformations
  - 1.1.3 Basic Digital Communication Nomenclature
  - 1.1.4 Digital Versus Analog Performance Criteria
- 1.2 Classification of Signals
  - 1.2.1 Deterministic and Random Signals
  - 1.2.2 Periodic and Nonperiodic Signals
  - 1.2.3 Analog and Discrete Signals
  - 1.2.4 Energy and Power Signals
  - 1.2.5 The Unit Impulse Function
- 1.3 Spectral Density

Pearson

Table of Contents

1.3.1 Energy Spectral Density

1.3.2 Power Spectral Density

1.4 Autocorrelation

1.4.1 Autocorrelation of an Energy Signal

1.4.2 Autocorrelation of a Periodic (Power) Signal

1.5 Random Signals

1.5.1 Random Variables

1.5.2 Random Processes

1.5.3 Time Averaging and Ergodicity

1.5.4 Power Spectral Density and Autocorrelation of a Random Process

1.5.5 Noise in Communication Systems

1.6 Signal Transmission Through Linear Systems

1.6.1 Impulse Response

1.6.2 Frequency Transfer Function

1.6.3 Distortionless Transmission

1.6.4 Signals, Circuits, and Spectra

1.7 Bandwidth of Digital Data

1.7.1 Baseband Versus Bandpass

1.7.2 The Bandwidth Dilemma

1.8 Conclusion

2 FORMATTING AND BASEBAND MODULATION

2.1 Baseband Systems

2.2 Formatting Textual Data (Character Coding)

2.3 Messages, Characters, and Symbols

2.3.1 Example of Messages, Characters, and Symbols

2.4 Formatting Analog Information

2.4.1 The Sampling Theorem

2.4.2 Aliasing

Pearson

Table of Contents

2.4.3 Why Oversample?

2.4.4 Signal Interface for a Digital System

2.5 Sources of Corruption

2.5.1 Sampling and Quantizing Effects

2.5.2 Channel Effects

2.5.3 Signal-to-Noise Ratio for Quantized Pulses

2.6 Pulse Code Modulation

2.7 Uniform and Nonuniform Quantization

2.7.1 Statistics of Speech Amplitudes

2.7.2 Nonuniform Quantization

2.7.3 Companding Characteristics

2.8 Baseband Transmission

2.8.1 Waveform Representation of Binary Digits

2.8.2 PCM Waveform Types

2.8.3 Spectral Attributes of PCM Waveforms

2.8.4 Bits per PCM Word and Bits per Symbol

2.8.5 M-ary Pulse-Modulation Waveforms

2.9 Correlative Coding

2.9.1 Duobinary Signaling

2.9.2 Duobinary Decoding

2.9.3 Precoding

2.9.4 Duobinary Equivalent Transfer Function

2.9.5 Comparison of Binary and Duobinary Signaling

2.9.6 Polybinary Signaling

2.10 Conclusion

3 BASEBAND DEMODULATION/DETECTION

3.1 Signals and Noise

3.1.1 Error-Performance Degradation in Communication Systems

3.1.2 Demodulation and Detection

Table of Contents

3.1.3 A Vectorial View of Signals and Noise

3.1.4 The Basic SNR Parameter for Digital Communication Systems

3.1.5 Why E[sub(b)]/N[sub(o)] Is a Natural Figure of Merit

3.2 Detection of Binary Signals in Gaussian Noise

3.2.1 Maximum Likelihood Receiver Structure

3.2.2 The Matched Filter

3.2.3 Correlation Realization of the Matched Filter

3.2.4 Optimizing Error Performance

3.2.5 Error Probability Performance of Binary Signaling

3.3 Intersymbol Interference

3.3.1 Pulse Shaping to Reduce ISI

3.3.2 Two Types of Error-Performance Degradation

3.3.3 Demodulation/Detection of Shaped Pulses

3.4 Equalization

3.4.1 Channel Characterization

3.4.2 Eye Pattern

3.4.3 Equalizer Filter Types

3.4.4 Preset and Adaptive Equalization

3.4.5 Filter Update Rate

3.5 Conclusion

4 BANDPASS MODULATION AND DEMODULATION/DETECTION

4.1 Why Modulate?

4.2 Digital Bandpass Modulation Techniques

4.2.1 Phasor Representation of a Sinusoid

4.2.2 Phase-Shift Keying

4.2.3 Frequency-Shift Keying

4.2.4 Amplitude Shift Keying

4.2.5 Amplitude-Phase Keying

Table of Contents

4.2.6 Waveform Amplitude Coefficient

4.3 Detection of Signals in Gaussian Noise

4.3.1 Decision Regions

4.3.2 Correlation Receiver

4.4 Coherent Detection

4.4.1 Coherent Detection of PSK

4.4.2 Sampled Matched Filter

4.4.3 Coherent Detection of Multiple Phase-Shift Keying

4.4.4 Coherent Detection of FSK

4.5 Noncoherent Detection

4.5.1 Detection of Differential PSK

4.5.2 Binary Differential PSK Example

4.5.3 Noncoherent Detection of FSK

4.5.4 Required Tone Spacing for Noncoherent Orthogonal FSK Signaling

4.6 Complex Envelope

4.6.1 Quadrature Implementation of a Modulator

4.6.2 D8PSK Modulator Example

4.6.3 D8PSK Demodulator Example

4.7 Error Performance for Binary Systems

4.7.1 Probability of Bit Error for Coherently Detected BPSK

4.7.2 Probability of Bit Error for Coherently Detected, Differentially Encoded Binary PSK

4.7.3 Probability of Bit Error for Coherently Detected Binary Orthogonal FSK

4.7.4 Probability of Bit Error for Noncoherently Detected Binary Orthogonal FSK

4.7.5 Probability of Bit Error for Binary DPSK

4.7.6 Comparison of Bit-Error Performance for Various Modulation Types

4.8 M-ary Signaling and Performance

4.8.1 Ideal Probability of Bit-Error Performance

4.8.2 M-ary Signaling

Table of Contents

4.8.3 Vectorial View of MPSK Signaling

4.8.4 BPSK and QPSK Have the Same Bit-Error Probability

4.8.5 Vectorial View of MFSK Signaling

4.9 Symbol Error Performance for M-ary Systems (M> 2)

4.9.1 Probability of Symbol Error for MPSK

4.9.2 Probability of Symbol Error for MFSK

4.9.3 Bit-Error Probability Versus Symbol Error Probability for Orthogonal Signals

4.9.4 Bit-Error Probability Versus Symbol Error Probability for Multiple-Phase Signaling

4.9.5 Effects of Intersymbol Interference

4.10 Conclusion

5 COMMUNICATIONS LINK ANALYSIS

5.1 What the System Link Budget Tells the System Engineer

5.2 The Channel

5.2.1 The Concept of Free Space

5.2.2 Error-Performance Degradation

5.2.3 Sources of Signal Loss and Noise

5.3 Received Signal Power and Noise Power

5.3.1 The Range Equation

5.3.2 Received Signal Power as a Function of Frequency

5.3.3 Path Loss Is Frequency Dependent

5.3.4 Thermal Noise Power

5.4 Link Budget Analysis

5.4.1 Two E[sub(b)]/N[sub(o)] Values of Interest

5.4.2 Link Budgets Are Typically Calculated in Decibels

5.4.3 How Much Link Margin Is Enough?

5.4.4 Link Availability

5.5 Noise Figure, Noise Temperature, and System Temperature

5.5.1 Noise Figure

Table of Contents

5.5.2 Noise Temperature

5.5.3 Line Loss

5.5.4 Composite Noise Figure and Composite Noise Temperature

5.5.5 System Effective Temperature

5.5.6 Sky Noise Temperature

5.6 Sample Link Analysis

5.6.1 Link Budget Details

5.6.2 Receiver Figure of Merit

5.6.3 Received Isotropic Power

5.7 Satellite Repeaters

5.7.1 Nonregenerative Repeaters

5.7.2 Nonlinear Repeater Amplifiers

5.8 System Trade-Offs

5.9 Conclusion

6 CHANNEL CODING: PART 1: WAVEFORM CODES AND BLOCK CODES

6.1 Waveform Coding and Structured Sequences

6.1.1 Antipodal and Orthogonal Signals

6.1.2 M-ary Signaling

6.1.3 Waveform Coding

6.1.4 Waveform-Coding System Example

6.2 Types of Error Control

6.2.1 Terminal Connectivity

6.2.2 Automatic Repeat Request

6.3 Structured Sequences

6.3.1 Channel Models

6.3.2 Code Rate and Redundancy

6.3.3 Parity-Check Codes

Table of Contents

6.3.4 Why Use Error-Correction Coding?

6.4 Linear Block Codes

6.4.1 Vector Spaces

6.4.2 Vector Subspaces

6.4.3 A (6, 3) Linear Block Code Example

6.4.4 Generator Matrix

6.4.5 Systematic Linear Block Codes

6.4.6 Parity-Check Matrix

6.4.7 Syndrome Testing

6.4.8 Error Correction

6.4.9 Decoder Implementation

6.5 Error-Detecting and Error-Correcting Capability

6.5.1 Weight and Distance of Binary Vectors

6.5.2 Minimum Distance of a Linear Code

6.5.3 Error Detection and Correction

6.5.4 Visualization of a 6-Tuple Space

6.5.5 Erasure Correction

6.6 Usefulness of the Standard Array

6.6.1 Estimating Code Capability

6.6.2 An (n, k) Example

6.6.3 Designing the (8, 2) Code

6.6.4 Error Detection Versus Error Correction Trade-Offs

6.6.5 The Standard Array Provides Insight

6.7 Cyclic Codes

6.7.1 Algebraic Structure of Cyclic Codes

6.7.2 Binary Cyclic Code Properties

6.7.3 Encoding in Systematic Form

6.7.4 Circuit for Dividing Polynomials

6.7.5 Systematic Encoding with an (n k)-Stage Shift Register

Table of Contents

6.7.6 Error Detection with an (n k)-Stage Shift Register

6.8 Well-Known Block Codes

6.8.1 Hamming Codes

6.8.2 Extended Golay Code

6.8.3 BCH Codes

6.9 Conclusion

7 CHANNEL CODING: PART 2: CONVOLUTIONAL CODES AND REEDSOLOMON CODES

7.1 Convolutional Encoding

7.2 Convolutional Encoder Representation

7.2.1 Connection Representation

7.2.2 State Representation and the State Diagram

7.2.3 The Tree Diagram

7.2.4 The Trellis Diagram

7.3 Formulation of the Convolutional Decoding Problem

7.3.1 Maximum Likelihood Decoding

7.3.2 Channel Models: Hard Versus Soft Decisions

7.3.3 The Viterbi Convolutional Decoding Algorithm

7.3.4 An Example of Viterbi Convolutional Decoding

7.3.5 Decoder Implementation

7.3.6 Path Memory and Synchronization

7.4 Properties of Convolutional Codes

7.4.1 Distance Properties of Convolutional Codes

7.4.2 Systematic and Nonsystematic Convolutional Codes

7.4.3 Catastrophic Error Propagation in Convolutional Codes

7.4.4 Performance Bounds for Convolutional Codes

7.4.5 Coding Gain

7.4.6 Best-Known Convolutional Codes

7.4.7 Convolutional Code Rate Trade-Off

Table of Contents

7.4.8 Soft-Decision Viterbi Decoding

7.5 Other Convolutional Decoding Algorithms

7.5.1 Sequential Decoding

7.5.2 Comparisons and Limitations of Viterbi and Sequential Decoding

7.5.3 Feedback Decoding

7.6 ReedSolomon Codes

7.6.1 ReedSolomon Error Probability

7.6.2 Why RS Codes Perform Well Against Burst Noise

7.6.3 RS Performance as a Function of Size, Redundancy, and Code Rate

7.6.4 Finite Fields

7.6.5 ReedSolomon Encoding

7.6.6 ReedSolomon Decoding

7.7 Interleaving and Concatenated Codes

7.7.1 Block Interleaving

7.7.2 Convolutional Interleaving

7.7.3 Concatenated Codes

7.8 Coding and Interleaving Applied to the Compact Disc Digital Audio System

7.8.1 CIRC Encoding

7.8.2 CIRC Decoding

7.8.3 Interpolation and Muting

7.9 Conclusion

8 CHANNEL CODING: PART 3: TURBO CODES AND LOW-DENSITY PARITY CHECK (LDPC) CODES

8.1 Turbo Codes

8.1.1 Turbo Code Concepts

8.1.2 Log-Likelihood Algebra

8.1.3 Product Code Example

8.1.4 Encoding with Recursive Systematic Codes

Table of Contents

8.1.5 A Feedback Decoder

8.1.6 The MAP Algorithm

8.1.7 MAP Decoding Example

8.2 Low-Density Parity Check (LDPC) Codes

8.2.1 Background and Overview

8.2.2 The Parity-Check Matrix

8.2.3 Finding the Best-Performing Codes

8.2.4 Decoding: An Overview

8.2.5 Mathematical Foundations

8.2.6 Decoding in the Probability Domain

8.2.7 Decoding in the Logarithmic Domain

8.2.8 Reduced-Complexity Decoders

8.2.9 LDPC Performance

8.2.10 Conclusion

Appendix 8A: The Sum of Log-Likelihood Ratios

Appendix 8B: Using Bayes Theorem to Simplify the Bit Conditional Probability

Appendix 8C: Probability that a Binary Sequence Contains an Even Number of Ones

Appendix 8D: Simplified Expression for the Hyperbolic Tangent of the Natural Log of a Ratio of Binary Probabilities

Appendix 8E: Proof that Ø(x) = Ø[sup(-1)] (x)

Appendix 8F: Bit Probability Initialization

9 MODULATION AND CODING TRADE-OFFS

9.1 Goals of the Communication System Designer

9.2 Error-Probability Plane

9.3 Nyquist Minimum Bandwidth

9.4 ShannonHartley Capacity Theorem

Table of Contents

9.4.1 Shannon Limit

9.4.2 Entropy

9.4.3 Equivocation and Effective Transmission Rate

9.5 Bandwidth-Efficiency Plane

9.5.1 Bandwidth Efficiency of MPSK and MFSK Modulation

9.5.2 Analogies Between the Bandwidth-Efficiency and Error-Probability Planes

9.6 Modulation and Coding Trade-Offs

9.7 Defining, Designing, and Evaluating Digital Communication Systems

9.7.1 M-ary Signaling

9.7.2 Bandwidth-Limited Systems

9.7.3 Power-Limited Systems

9.7.4 Requirements for MPSK and MFSK Signaling

9.7.5 Bandwidth-Limited Uncoded System Example

9.7.6 Power-Limited Uncoded System Example

9.7.7 Bandwidth-Limited and Power-Limited Coded System Example

9.8 Bandwidth-Efficient Modulation

9.8.1 QPSK and Offset QPSK Signaling

9.8.2 Minimum-Shift Keying

9.8.3 Quadrature Amplitude Modulation

9.9 Trellis-Coded Modulation

9.9.1 The Idea Behind Trellis-Coded Modulation

9.9.2 TCM Encoding

9.9.3 TCM Decoding

9.9.4 Other Trellis Codes

9.9.5 Trellis-Coded Modulation Example

9.9.6 Multidimensional Trellis-Coded Modulation

9.10 Conclusion

Table of Contents

10 SYNCHRONIZATION

10.1 Receiver Synchronization

10.1.1 Why We Must Synchronize

10.1.2 Alignment at the Waveform Level and Bit Stream Level

10.1.3 Carrier-Wave Modulation

10.1.4 Carrier Synchronization

10.1.5 Symbol Synchronization

10.1.6 Eye Diagrams and Constellations

10.2 Synchronous Demodulation

10.2.1 Minimizing Energy in the Difference Signal

10.2.2 Finding the Peak of the Correlation Function

10.2.3 The Basic Analog Phase-Locked Loop (PLL)

10.2.4 Phase-Locking Remote Oscillators

10.2.5 Estimating Phase Slope (Frequency)

10.3 Loop Filters, Control Circuits, and Acquisition

10.3.1 How Many Loop Filters Are There in a System?

10.3.2 The Key Loop Filters

10.3.3 Why We Want R Times R-dot

10.3.4 The Phase Error S-Curve

10.4 Phase-Locked Loop Timing Recovery

10.4.1 Recovering Carrier Timing from a Modulated Waveform

10.4.2 Classical Timing Recovery Architectures

10.4.3 Timing-Error Detection: Insight from the Correlation Function

10.4.4 Maximum-Likelihood Timing-Error Detection

10.4.5 Polyphase Matched Filter and Derivative Matched Filter

10.4.6 Approximate ML Timing Recovery PLL for a 32-Path PLL

10.5 Frequency Recovery Using a Frequency-Locked Loop (FLL)

10.5.1 Band-Edge Filters

10.5.2 Band-Edge Filter Non-Data-Aided Timing Synchronization

Pearson

Table of Contents

10.6 Effects of Phase and Frequency Offsets

10.6.1 Phase Offset and No Spinning: Effect on Constellation

10.6.2 Slow Spinning Effect on Constellation

10.6.3 Fast Spinning Effect on Constellation

10.7 Conclusion

11 MULTIPLEXING AND MULTIPLE ACCESS

11.1 Allocation of the Communications Resource

11.1.1 Frequency-Division Multiplexing/Multiple Access

11.1.2 Time-Division Multiplexing/Multiple Access

11.1.3 Communications Resource Channelization

11.1.4 Performance Comparison of FDMA and TDMA

11.1.5 Code-Division Multiple Access

11.1.6 Space-Division and Polarization-Division Multiple Access

11.2 Multiple-Access Communications System and Architecture

11.2.1 Multiple-Access Information Flow

11.2.2 Demand-Assignment Multiple Access

11.3 Access Algorithms

11.3.1 ALOHA

11.3.2 Slotted ALOHA

11.3.3 Reservation ALOHA

11.3.4 Performance Comparison of S-ALOHA and R-ALOHA

11.3.5 Polling Techniques

11.4 Multiple-Access Techniques Employed with INTELSAT

11.4.1 Preassigned FDM/FM/FDMA or MCPC Operation

11.4.2 MCPC Modes of Accessing an INTELSAT Satellite

11.4.3 SPADE Operation

11.4.4 TDMA in INTELSAT

11.4.5 Satellite-Switched TDMA in INTELSAT

11.5 Multiple-Access Techniques for Local Area Networks

Table of Contents

11.5.1 Carrier-Sense Multiple-Access Networks

11.5.2 Token-Ring Networks

11.5.3 Performance Comparison of CSMA/CD and Token-Ring Networks

11.6 Conclusion

12 SPREAD-SPECTRUM TECHNIQUES

12.1 Spread-Spectrum Overview

12.1.1 The Beneficial Attributes of Spread-Spectrum Systems

12.1.2 A Catalog of Spreading Techniques

12.1.3 Model for Direct-Sequence Spread-Spectrum Interference Rejection

12.1.4 Historical Background

12.2 Pseudonoise Sequences

12.2.1 Randomness Properties

12.2.2 Shift Register Sequences

12.2.3 PN Autocorrelation Function

12.3 Direct-Sequence Spread-Spectrum Systems

12.3.1 Example of Direct Sequencing

12.3.2 Processing Gain and Performance

12.4 Frequency-Hopping Systems

12.4.1 Frequency-Hopping Example

12.4.2 Robustness

12.4.3 Frequency Hopping with Diversity

12.4.4 Fast Hopping Versus Slow Hopping

12.4.5 FFH/MFSK Demodulator

12.4.6 Processing Gain

12.5 Synchronization

12.5.1 Acquisition

12.5.2 Tracking

12.6 Jamming Considerations

12.6.1 The Jamming Game

Table of Contents

12.6.2 Broadband Noise Jamming
12.6.3 Partial-Band Noise Jamming
12.6.4 Multiple-Tone Jamming
12.6.5 Pulse Jamming
12.6.6 Repeat-Back Jamming
12.6.7 BLADES System
12.7 Commercial Applications
12.7.1 Code-Division Multiple Access
12.7.2 Multipath Channels
12.7.3 The FCC Part 15 Rules for Spread-Spectrum Systems
12.7.4 Direct Sequence Versus Frequency Hopping
12.8 Cellular Systems
12.8.1 Direct-Sequence CDMA
12.8.2 Analog FM Versus TDMA Versus CDMA
12.8.3 Interference-Limited Versus Dimension-Limited Systems
12.8.4 IS-95 CDMA Digital Cellular System
12.9 Conclusion
13 SOURCE CODING
13.1 Sources
13.1.1 Discrete Sources
13.1.2 Waveform Sources
13.2 Amplitude Quantizing
13.2.1 Quantizing Noise
13.2.2 Uniform Quantizing
13.2.3 Saturation
13.2.4 Dithering
13.2.5 Nonuniform Quantizing
13.3 Pulse Code Modulation
13.3.1 Differential Pulse Code Modulation

Table of Contents

13.3.2 One-Tap Prediction

13.3.3 N-Tap Prediction

13.3.4 Delta Modulation

13.3.5 - Modulation

13.3.6 - A-to-D Converter (ADC)

13.3.7 - D-to-A Converter (DAC)

13.4 Adaptive Prediction

13.4.1 Forward Adaptation

13.4.2 Synthesis/Analysis Coding

13.5 Block Coding

13.5.1 Vector Quantizing

13.6 Transform Coding

13.6.1 Quantization for Transform Coding

13.6.2 Subband Coding

13.7 Source Coding for Digital Data

13.7.1 Properties of Codes

13.7.2 Huffman Code

13.7.3 Run-Length Codes

13.8 Examples of Source Coding

13.8.1 Audio Compression

13.8.2 Image Compression

13.9 Conclusion

14 FADING CHANNELS

14.1 The Challenge of Communicating over Fading Channels

14.2 Characterizing Mobile-Radio Propagation

14.2.1 Large-Scale Fading

14.2.2 Small-Scale Fading

14.3 Signal Time Spreading

Table of Contents

14.3.1 Signal Time Spreading Viewed in the Time-Delay Domain

14.3.2 Signal Time Spreading Viewed in the Frequency Domain

14.3.3 Examples of Flat Fading and Frequency-Selective Fading

14.4 Time Variance of the Channel Caused by Motion

14.4.1 Time Variance Viewed in the Time Domain

14.4.2 Time Variance Viewed in the Doppler-Shift Domain

14.4.3 Performance over a Slow- and Flat-Fading Rayleigh Channel

14.5 Mitigating the Degradation Effects of Fading

14.5.1 Mitigation to Combat Frequency-Selective Distortion

14.5.2 Mitigation to Combat Fast-Fading Distortion

14.5.3 Mitigation to Combat Loss in SNR

14.5.4 Diversity Techniques

14.5.5 Modulation Types for Fading Channels

14.5.6 The Role of an Interleaver

14.6 Summary of the Key Parameters Characterizing Fading Channels

14.6.1 Fast-Fading Distortion: Case 1

14.6.2 Frequency-Selective Fading Distortion: Case 2

14.6.3 Fast-Fading and Frequency-Selective Fading Distortion: Case 3

14.7 Applications: Mitigating the Effects of Frequency-Selective Fading

14.7.1 The Viterbi Equalizer as Applied to GSM

14.7.2 The Rake Receiver Applied to Direct-Sequence Spread-Spectrum (DS/SS) Systems

14.8 Conclusion

15 THE ABCs OF OFDM (ORTHOGONAL FREQUENCY- DIVISION MULTIPLEXING)

15.1 What Is OFDM?

15.2 Why OFDM?

15.3 Getting Started with OFDM

Table of Contents

15.4 Our Wish List (Preference for Flat Fading and Slow Fading)

15.4.1 OFDMs Most Important Contribution to Communications over Multipath Channels

15.5 Conventional Multi-Channel FDM versus Multi-Channel OFDM

15.6 The History of the Cyclic Prefix (CP)

15.6.1 Examining the Lengthened Symbol in OFDM

15.6.2 The Length of the CP

15.7 OFDM System Block Diagram

15.8 Zooming in on the IDFT

15.9 An Example of OFDM Waveform Synthesis

15.10 Summarizing OFDM Waveform Synthesis

15.11 Data Constellation Points Distributed over the Subcarrier Indexes

15.11.1 Signal Processing in the OFDM Receiver

15.11.2 OFDM Symbol-Time Duration

15.11.3 Why DC Is Not Used as a Subcarrier in Real Systems

15.12 Hermitian Symmetry

15.13 How Many Subcarriers Are Needed?

15.14 The Importance of the Cyclic Prefix (CP) in OFDM

15.14.1 Properties of Continuous and Discrete Fourier Transforms

15.14.2 Reconstructing the OFDM Subcarriers

15.14.3 A Property of the Discrete Fourier Transform (DFT)

15.14.4 Using Circular Convolution for Reconstructing an OFDM Subcarrier

15.14.5 The Trick That Makes Linear Convolution Appear Circular

15.15 An Early OFDM Application: Wi-Fi Standard 802.11a

15.15.1 Why the Transform Size N Needs to Be Larger Than the Number of Subcarriers

15.16 Cyclic Prefix (CP) and Tone Spacing

15.17 Long-Term Evolution (LTE) Use of OFDM

Table of Contents

15.17.1 LTE Resources: Grid, Block, and Element

15.17.2 OFDM Frame in LTE

15.18 Drawbacks of OFDM

15.18.1 Sensitivity to Doppler

15.18.2 Peak-to-Average Power Ratio (PAPR) and SC-OFDM

15.18.3 Motivation for Reducing PAPR

15.19 Single-Carrier OFDM (SC-OFDM) for Improved PAPR Over Standard OFDM

15.19.1 SC-OFDM Signals Have Short Mainlobe Durations

15.19.2 Is There an Easier Way to Implement SC-OFDM?

15.20 Conclusion

16 THE MAGIC OF MIMO (MULTIPLE INPUT/MULTIPLE OUTPUT)

16.1 What is MIMO?

16.1.1 MIMO Historical Perspective

16.1.2 Vectors and Phasors

16.1.3 MIMO Channel Model

16.2 Various Benefits of Multiple Antennas

16.2.1 Array Gain

16.2.2 Diversity Gain

16.2.3 SIMO Receive Diversity Example

16.2.4 MISO Transmit Diversity Example

16.2.5 Two-Time Interval MISO Diversity Example

16.2.6 Coding Gain

16.2.7 Visualization of Array Gain, Diversity Gain, and Coding Gain

16.3 Spatial Multiplexing

16.3.1 Basic Idea of MIMO-Spatial Multiplexing (MIMO-SM)

16.3.2 Analogy Between MIMO-SM and CDMA

16.3.3 When Only the Receiver Has Channel-State Information (CSI)

Table of Contents

16.3.4 Impact of the Channel Model

16.3.5 MIMO and OFDM Form a Natural Coupling

16.4 Capacity Performance

16.4.1 Deterministic Channel Modeling

16.4.2 Random Channel Models

16.5 Transmitter Channel-State Information (CSI)

16.5.1 Optimum Power Distribution

16.6 Space-Time Coding

16.6.1 Block Codes in MIMO Systems

16.6.2 Trellis Codes in MIMO Systems

16.7 MIMO Trade-Offs

16.7.1 Fundamental Trade-Off

16.7.2 Trade-Off Yielding Greater Robustness for PAM and QAM

16.7.3 Trade-Off Yielding Greater Capacity for PAM and QAM

16.7.4 Tools for Trading Off Multiplexing Gain and Diversity Gain

16.8 Multi-User MIMO (MU-MIMO)

16.8.1 What Is MU-MIMO?

16.8.2 SU-MIMO and MU-MIMO Notation

16.8.3 A Real Shift in MIMO Thinking

16.8.4 MU-MIMO Capacity

16.8.5 Sum-Rate Capacity Comparison for Various Precoding Strategies

16.8.6 MU-MIMO Versus SU-MIMO Performance

16.9 Conclusion
