About the Author

Nomenclature

Chapter 1 Introduction to Separation Process Engineering

1.0 SummaryObjectives

1.1 Importance of Separations

1.2 Concept of Equilibrium

1.3 Mass Transfer Concepts

1.4 Problem-Solving Methods

1.5 Units

1.6 Computers and Computer Simulations

1.7 Prerequisite Material

1.8 Other Resources on Separation Process Engineering

References

Problems

Chapter 2 Flash Distillation

2.0 SummaryObjectives

2.1 Basic Method of Flash Distillation

Table of Contents

2.2 Form and Sources of Equilibrium Data

2.3 Binary VLE

2.3.1 Graphical Binary VLE

2.3.2 Binary VLE Equations

2.4 Binary Flash Distillation

2.4.1 Sequential Solution Procedure

Example 2-1. Flash distillation of ethanol and water

2.4.2 Simultaneous Solution Procedure

2.4.3 Simultaneous Solution on Enthalpy-Composition Diagram

2.5 Multicomponent VLE

2.6 Multicomponent Flash Distillation

Example 2-2. Multicomponent flash distillation

2.7 Simultaneous Multicomponent Convergence

Example 2-3. Simultaneous solution for multicomponent flash distillation

2.8 Three-Phase Flash Calculations

2.9 Size Calculation

Example 2-4. Calculation of drum size

2.10 Using Existing Flash Drums

References

Problems

Appendix A. Computer Simulation of Flash Distillation

Lab 1. Introduction to Aspen Plus

Lab 2. Flash Distillation

Appendix B. Spreadsheets for Flash Distillation

2.B.1. Binary Flash Distillation with Excel

Example 2-B1. Binary flash distillation of ethanol-water

2.B.2. Multicomponent Flash Distillation with Excel

Chapter 3 Introduction to Column Distillation

3.0 Summary Objectives

3.1 Developing a Distillation Cascade

3.2 Tray Column Distillation Equipment

3.3 Safety

Table of Contents

3.4 Specifications

3.5 External Column Balances

Example 3-1. External balances for binary distillation

References

Problems

Chapter 4 Binary Column Distillation: Internal Stage-by-Stage Balances

4.0 Summary Objectives

4.1 Internal Balances

4.2 Binary Stage-by-Stage Solution Methods

Example 4-1. Stage-by-stage calculations by the Lewis method

4.3 Introduction to the McCabe-Thiele Method

4.4 Feed Line

Example 4-2. Feed line calculations

4.5 Complete McCabe-Thiele Method

Example 4-3. McCabe-Thiele method

4.6 Profiles for Binary Distillation

4.7 Open Steam Heating

Example 4-4. McCabe-Thiele analysis of open steam heating

4.8 General McCabe-Thiele Analysis Procedure

Example 4-5. Distillation with two feeds

4.9 Other Distillation Column Situations

4.9.1 Partial Condensers

4.9.2 Total Reboilers

4.9.3 Side Streams or Withdrawal Lines

4.9.4 Intermediate Reboilers and Intermediate Condensers

4.9.5 Stripping and Enriching Columns

4.9.6 Column Flash Distillation

4.10 Limiting Operating Conditions

4.11 Efficiencies

4.12 Subcooled Reflux and Superheated Boilup

4.13 Simulation Problems

Table of Contents

4.14 New Uses for Old Columns

4.15 Comparisons between Analytical and Graphical Methods

References

Problems

Appendix A. Computer Simulation of Binary Distillation

Lab 3. Binary Distillation

Appendix B. Spreadsheet for Binary Distillation

Example 4-B1. Binary distillation of ethanol-water

Chapter 5 Introduction to Multicomponent Distillation

5.0 Summary Objectives

5.1 Calculational Difficulties of Multicomponent Distillation

Example 5-1. External mass balances using fractional recoveries

5.2 Profiles for Multicomponent Distillation

5.3 Stage-by-Stage Calculations for CMO

Example 5-2. Bubble-point calculation

References

Problems

Appendix A. Simplified Spreadsheet for Stage-by-Stage Calculations for Ternary Distillation

Example 5-A1. Stage-by-stage calculations for stripping column

Chapter 6 Exact Calculation Procedures for Multicomponent Distillation

6.0 Summary Objectives

6.1 Introduction to Matrix Solution for Multicomponent Distillation

6.2 Component Mass Balances in Matrix Form

6.3 Initial Guesses for Flow Rates and Temperatures

6.4 Temperature Convergence

Example 6-1. Matrix and bubble-point calculations

6.5 Energy Balances in Matrix Form

6.6 Introduction to Naphtali-Sandholm Simultaneous Convergence Method

6.7 Discussion

Table of Contents

References

Problems

Appendix. Computer Simulations for Multicomponent Column Distillation

Lab 4. Simulation of Multicomponent Distillation

Lab 5. Pressure Effects and Tray Efficiencies

Lab 6. Coupled Columns

Chapter 7 Approximate Shortcut Methods for Multicomponent Distillation

7.0 Summary Objectives

7.1 Total Reflux : Fenske Equation

Example 7-1. Fenske equation

7.2 Minimum Reflux: Underwood Equations

Example 7-2. Underwood equations

7.3 Gilliland Correlation for Number of Stages at Finite Reflux Ratios

Example 7-3. Gilliland correlation

References

Problems

Chapter 8 Introduction to Complex Distillation Methods

8.0 Summary Objectives

8.1 Breaking Azeotropes with Hybrid Separations

8.2 Binary Heterogeneous Azeotropic Distillation Processes

8.2.1 Binary Heterogeneous Azeotropes Single-Column System

8.2.2 Drying Organic Compounds That Are Almost Immiscible with Water

Example 8-1. Drying benzene by distillation

8.2.3 Binary Heterogeneous Azeotropes Two-Column Systems

8.3 Continuous Steam Distillation

8.3.1 Equilibrium

8.3.2 One-Stage Continuous Steam Distillation

Example 8-2. Single-stage continuous steam distillation

8.3.3 Continuous Steam Distillation with Multiple Stages

8.4 Pressure-Swing Distillation Processes

8.5 Complex Ternary Distillation Systems

Table of Contents

8.5.1 Distillation Curves

Example 8-3. Development of distillation curves for constant relative volatility

8.5.2 Residue Curves

8.5.3 Mass Balances on Distillation Curve and Residue Curve Diagrams

8.6 Extractive Distillation

8.7 Azeotropic Distillation with Added Solvent

8.8 Distillation with Chemical Reaction

References

Problems

Appendix A. Simulation of Complex Distillation Systems

Lab 7. Pressure-Swing Distillation for Separating Azeotropes

Lab 8. Binary Distillation of Systems with Heterogeneous Azeotropes

Lab 9. Simulation of Extractive Distillation

Appendix B. Spreadsheet for Distillation curve Generation for Constant Relative Volatility at Total Reflux

Chapter 9 Batch Distillation

9.0 Summary Objectives

9.1 Introduction to Batch Distillation

9.2 Batch Distillation: Rayleigh Equation

9.2.1 Mixed Distillate Product

9.2.2 Distillate Product Fractions

9.3 Simple Binary Batch Distillation

Example 9-1. Simple binary Rayleigh distillation

9.4 Constant-Mole Batch Distillation

Example 9-2. Solvent exchange by constant-mole batch distillation

9.5 Batch Steam Distillation

Example 9-3. Batch steam distillation

9.6 Multistage Binary Batch Distillation

9.6.1 Constant Reflux Ratio

Example 9-4. Multistage batch distillation

9.6.2 Variable Reflux Ratio

Table of Contents

9.7 Multicomponent Simple Batch Distillation and Residue Curve Calculations

Example 9-5. Multicomponent simple batch distillation

9.8 Operating Time

References

Problems

Appendix A. Calculations for Simple Multicomponent Batch Distillation and Residue Curve Analysis

Chapter 10 Staged and Packed Column Design

10.0 Summary Objectives

10.1 Staged Column Equipment Description

10.1.1 Trays, Downcomers, and Weirs

10.1.2 Inlets and Outlets

10.2 Tray Efficiencies

10.2.1 Efficiency Definitions

10.2.2 Prediction of Efficiencies

Example 10-1. Overall efficiency estimation

10.2.3 Laboratory and Pilot Plant Data

10.3 Column Diameter Calculations

Example 10-2. Diameter calculation for tray column

10.4 Balancing Calculated Diameters

10.5 Sieve Tray Layout and Tray Hydraulics

Example 10-3. Tray layout and hydraulics

10.6 Valve Tray Design

10.7 Introduction to Packed Column Design

10.8 Packings and Packed Column Internals

10.9 Packed Column Design: HETP Method

10.9.1 Experimental Determination of HETP

10.9.2 HETP Behavior

10.9.3 Data-Heuristic Design of Packed Columns

10.10 Packed Column Flooding and Diameter Calculation

Example 10-4. Packed column diameter calculation

Table of Contents

Example 10-5. Alternate packed column diameter calculation

10.11 Economic Trade-Offs for Packed Columns

10.12 Choice of Column Type

10.13 Fire Hazards of Structured Packings

References

Problems

Appendix. Tray and Downcomer Design with Computer Simulator

Lab 10. Detailed Design

Chapter 11 Economics and Energy Efficiency in Distillation

11.0 Summary Objectives

11.1 Equipment Costs

11.2 Basic Heat Exchanger Design

11.3 Design and Operating Effects on Costs

Example 11-1. Cost estimate for distillation

11.4 Changes in Plant Operating Rates

11.5 Energy Reduction in Binary Distillation Systems

11.5.1 Energy Conservation in Existing Plants

11.5.2 Energy Conservation in New Facilities

11.6 Synthesis of Column Sequences for Almost Ideal Multicomponent Distillation

11.6.1 Ternary Column Sequences

11.6.2 Heuristics for Sequences with More Components

Example 11-2. Sequencing columns with heuristics

11.7 Synthesis of Distillation Systems for Nonideal Ternary Systems

Example 11-3. Process development for separation of complex ternary mixture

11.8 Next Steps

References

Problems

Chapter 12 Absorption and Stripping

12.0 Summary Objectives

12.1 Absorption and Stripping Equilibria

12.2 McCabe-Thiele Solution for Dilute Absorption

Table of Contents

Example 12-1. McCabe-Thiele analysis for dilute absorber

12.3 Stripping Analysis for Dilute Systems

12.4 Analytical Solution for Dilute Systems: Kremser Equation

Example 12-2. Stripping analysis with the Kremser equation

12.5 Efficiencies

12.6 McCabe-Thiele Analysis for More Concentrated Systems

Example 12-3. Graphical analysis for more concentrated absorber

12.7 Column Diameter

12.8 Dilute Multisolute Absorbers and Strippers

12.9 Matrix Solution for Concentrated Absorbers and Strippers

12.10 Irreversible Absorption and Cocurrent Cascades

References

Problems

Appendix. Computer Simulations of Absorption and Stripping

Lab 11. Absorption and Stripping

Chapter 13 Liquid-Liquid Extraction

13.0 Summary Objectives

13.1 Introduction to Extraction Processes and Equipment

13.2 Equilibrium for Dilute Systems and Solvent Selection

13.3 Dilute, Immiscible, Countercurrent Extraction

13.3.1 McCabe-Thiele Method for Dilute Countercurrent Extraction

Example 13-1. Dilute countercurrent immiscible extraction

13.3.2 Kremser Solution for Dilute Countercurrent Extraction

13.3.3 Dilute Fractional Extraction

13.3.4 McCabe-Thiele Analysis of Fractional Extraction

13.3.5 Kremser Equation for Fractional Extraction

Example 13-2. Kremser solutions for counter-current and fractional extraction

13.4 Immiscible Single-Stage and Crossflow Extraction

Example 13-3. Single-stage and crossflow extraction of protein

13.5 Concentrated Immiscible Extraction

Example 13-4. Concentrated immiscible extraction

Table of Contents

13.6 Immiscible Batch Extraction

13.7 Extraction Equilibrium for Partially Miscible Ternary Systems

13.8 Mixing Calculations and the Lever-Arm Rule

13.9 Partially Miscible Single-Stage and Crossflow Systems

Example 13-5. Partially miscible single-stage extraction

13.10 Partially Miscible Countercurrent Extraction

13.10.1 External Mass Balances

13.10.2 Difference Points and Stage-by-Stage Calculations

13.10.3 Complete Partially Miscible Extraction Problem

Example 13-6. Countercurrent extraction

13.11 Relationship Between McCabe-Thiele and Triangular Diagrams for Partially Miscible Systems

13.12 Minimum Solvent Rate for Partially Miscible Systems

13.13 Extraction Computer Simulations

13.14 Design of Mixer-Settlers

Example 13-7. Mixer-settler design

References

Problems

Appendix. Computer Simulation of Extraction

Lab 12. Extraction

Chapter 14 Washing, Leaching, and Supercritical Extraction

14.0 Summary Objectives

14.1 Generalized McCabe-Thiele and Kremser Procedures

14.2 Washing

14.2.1 Continuous Washing

Example 14-1. Continuous washing

14.2.2 Batch Washing

14.3 Leaching

14.3.1 Leaching Analysis with Constant Flow Rates

14.3.2 Leaching Analysis with Variable Flow Rates

Example 14-2. Leaching calculation

14.3.3 Simulating Countercurrent Flow in Percolation Leaching

Table of Contents

14.4 Introduction to Supercritical Fluid Extraction

References

Problems

Chapter 15 Introduction to Diffusion and Mass Transfer

15.0 Summary-Objectives

15.1 Molecular Movement Leads to Mass Transfer

15.2 Fickian Model of Diffusivity

15.2.1 Ficks Law and the Fickian Definition of Diffusivity

15.2.2 Steady-State Binary Fickian Diffusion and Mass Balances without Convection

Example 15-1. Determination of diffusivity in dilute binary mixture

Example 15-2. Steady-state diffusion without convection: Low-temperature evaporation

15.2.3 Unsteady Binary Fickian Diffusion with No Convection (Optional)

15.2.4 Steady-State Binary Fickian Diffusion and Mass Balances with Convection

Example 15-3. Steady-state diffusion with convection: High-temperature evaporation

15.3 Values and Correlations for Fickian Binary Diffusivities

15.3.1 Fickian Binary Gas Diffusivities

Example 15-4. Estimation of temperature effect on Fickian gas diffusivity

15.3.2 Fickian Binary Liquid Diffusivities

15.3.3 Numerical Solution with Variable Binary Diffusivity

Example 15-5. Numerical solution for variable diffusivity and molar concentration

15.4 Linear Driving-Force Model of Mass Transfer for Binary Systems

15.4.1 Film Theory for Dilute and Equimolar Transfer Systems

15.4.2 Transfer through Stagnant Films: Absorbers and Strippers

15.4.3 Binary Mass Transfer to Expanding or Contracting Objects

Example 15-6. Shrinking diameter of oxygen bubble

15.4.4 Binary Mass Transfer to Expanding or Contracting Objects: Variable Mass Transfer Coefficient

Example 15-7. Sublimation of solid particle

15.5 Correlations for Mass Transfer Coefficients

15.5.1 Dimensionless Groups

15.5.2 Theoretically Derived Mass Transfer Correlations

15.5.3 Semi-Empirical and Empirical Mass Transfer Coefficient Correlations

Example 15-8. Estimation of mass transfer coefficients

Table of Contents

15.5.4 Correlations Based on Analogies

15.6 Difficulties with Fickian Diffusion Model

15.7 Maxwell-Stefan Model of Diffusion and Mass Transfer

15.7.1 Introductory Development of the Maxwell-Stefan Theory of Diffusion

15.7.2 Maxwell-Stefan Equations for Binary Nonideal Systems

15.7.3 Determining Independent Fluxes $N_{j,z}$

15.7.4 Maxwell-Stefan Difference Equation Formulations

15.7.5 Relationship between Maxwell-Stefan and Fickian Diffusivities

Example 15-9. Maxwell-Stefan nonideal binary diffusion

15.7.6 Ideal Ternary Systems

Example 15-10. Maxwell-Stefan ideal ternary system

15.7.7 Ternary Mass Transfer to Expanding or Contracting Objects

Example 15-11. Ternary transfer from an evaporating drop

15.7.8 Nonideal Ternary Systems

15.8 Advantages and Disadvantages of Different Diffusion and Mass Transfer Models

15.9 Useful Approximate Values

References

Problems

Appendix. Spreadsheets for Examples 15-10 and 15-11

Chapter 16 Mass Transfer Analysis for Distillation, Absorption, Stripping, and Extraction

16.0 Summary Objectives

16.1 HTU-NTU Analysis of Packed Distillation Columns

Example 16-1. Distillation in a packed column

16.2 Relationship of HETP and HTU

16.3 Correlations for HTU Values for Packings

16.3.1 Bollés and Fair Correlation for HTU Values of Random Packings

Example 16-2. Estimation of HG and HL

16.3.2 Additional Correlations for Random and Structured Packings

16.4 HTU-NTU Analysis of Absorbers and Strippers

Example 16-3. Absorption of SO₂

Table of Contents

16.5 HTU-NTU Analysis of Cocurrent Absorbers

16.6 Prediction of Distillation Tray Efficiency

Example 16-4. Estimation of distillation stage efficiency

16.7 Mass Transfer Analysis of Extraction

16.7.1 Extraction Mass Transfer Equations and HTU-NTU Analysis

16.7.2 Calculation of Stage Efficiency in Extraction Mixers

Example 16-5. Conversion of mass transfer coefficients and estimation of mixer stage efficiency

16.7.3 Drop Size in Mixers

16.7.4 Mass Transfer Coefficients in Mixers

16.7.4.1 Mixer Mass Transfer Coefficients for Individual Drops (Optional)

16.7.4.2 Mass Transfer Coefficients for Drop Swarms in Mixers

16.7.4.3 Conservative Estimation of Mass Transfer Coefficients for Extraction

16.8 Rate-Based Analysis of Distillation

References

Problems

Appendix. Computer Rate-Based Simulation of Distillation

Lab 13. Rate-Based Modeling of Distillation

Chapter 17 Crystallization from Solution

17.0 Summary Objectives

17.1 Basic Principles of Crystallization from Solution

17.1.1 Crystallization Processes

17.1.2 Binary Equilibrium and Crystallizer Types

17.2 Continuous Cooling Crystallizers

17.2.1 Equilibrium and Mass Balances for Single Solute Producing Pure Solute Crystals

Example 17-1. Continuous cooling crystallizer mass balances without hydrates

Example 17-2. Continuous cooling crystallizer mass balances for hydrates

Example 17-3. Mixing solutions when hydrates are dissolved in water

17.2.2 Binary Eutectic Systems

Example 17-4. Eutectic equilibrium and mass balances

17.2.3 Deicing with Eutectic Systems

17.2.4 Eutectic Freeze Concentration (EFC)

17.2.5 Solid Solutions

Table of Contents

17.3 Evaporative and Vacuum Crystallizers

17.3.1 Equipment

17.3.2 Analysis of Evaporative Crystallizers for Single-Solute Systems for Producing Pure Solute Crystals

Example 17-5. Evaporative crystallizer without hydrate

Example 17-6. Evaporative crystallizer with hydrate

17.3.3 Simultaneous Mass, Energy, and Equilibrium Calculations

Example 17-7. Vacuum crystallizer: Simultaneous mass, energy, and equilibrium calculations

17.4 Experimental Crystal Size Distribution

Example 17-8. Screen analysis of crystallization data

17.5 Introduction to Population Balances

17.6 Crystal Size Distributions for MSMPR Crystallizers

17.6.1 Crystal Nucleation and Growth

17.6.2 Development of MSMPR Equation and Determination of G and n_0 from Experiment

Example 17-9. Determination of kinetic parameters from screen analysis data

17.6.3 Development and Application of Distributions for MSMPR Crystallizers

Example 17-10. Use of differential mass distribution to analyze screen analysis data

Example 17-11. Prediction of sieve analysis

Example 17-12. Combination of equilibrium and MSMPR distribution

17.7 Seeding

17.7.1 CSD Analysis for Growth on Seeds in Continuous Crystallizers

Example 17-13. CSD of seeded crystallizer

17.7.2 Controlling Crystal Size by Seeding

Example 17-14. Increasing crystal size with seeding

17.8 Scaleup

17.9 Batch and Semibatch Crystallization

17.9.1 Temperature Control for Batch Cooling Crystallizers

17.9.2 Antisolvent Crystallization

Example 17-15. Antisolvent and temperature reduction crystallization

17.10 Precipitation

17.10.1 Precipitation by Antisolvent Addition

17.10.2 Precipitation by Salting Out

Example 17-16. Salting out with a common ion

References

Table of Contents

Appendix. Spreadsheet

Chapter 18 Melt Crystallization

18.0 Summary Objectives

18.1 Equilibrium Calculations for Melt Crystallization

18.1.1 Binary Eutectic Systems

Example 18-1. Eutectic equilibrium and mass balances

18.1.2 Eutectic Equilibrium from Freezing Point Lowering Data

Example 18-2. Part A. Equilibrium from freezing point data

Example 18-2. Part B. Equilibrium from activity coefficients

18.1.3 Linear Equilibrium for Non-eutectic Melt Crystallization

18.2 Suspension Melt Crystallization

18.2.1 Process

18.2.2 Entrainment

Example 18-3. Entrainment effects

18.2.3 Wash Columns

18.2.4 Heat Transfer in Suspension Melt Crystallization

18.2.5 Film Mass Transfer in Suspension Melt Crystallization

18.2.6 MSMR and Seeded Crystallizer Analysis in Suspension Melt Crystallization

18.3 Introduction to Solid-Layer Crystallization Processes : Progressive Freezing

18.3.1 Heat and Mass Transfer in Progressive Freezing

18.3.2 Mass Balances and Impurity Levels

18.3.3 Heat and Mass Transfer Correlations for Progressive Freezing

18.3.4 Growth of the Crystal Layer in Progressive Freezing

Example 18-4. Preliminary calculations for progressive freezing

Example 18-5. Concentrated progressive freezing

18.3.5 Interpretation and Conclusions from Progressive Freezing Analysis

18.3.6 Progressive Freezing of Dilute, Non-eutectic, Linear Systems

Example 18-6. Dilute progressive freezing

18.4 Static Solid-Layer Melt Crystallization Process

18.5 Dynamic Solid-Layer Melt Crystallization

18.5.1 Staging Falling-Film Crystallizers

18.5.2 Mass and Energy Balances and Crystal Growth

Table of Contents

18.5.3 Heat and Mass Transfer Correlations for Falling Films

Example 18-7. Falling-film crystallizer

Comments on the Solution Method and the Example

18.6 Zone Melting

Example 18-8. Zone melting

18.7 Post-Crystallization Processing

18.8 Scaleup

18.9 Hybrid CrystallizationDistillation Processes

Example 18-9. Hybrid crystallization-distillation process

18.10 Predictions

18.10.1 Epitaph for Column Suspension Melt Crystallization Systems

18.10.2 The Future of Static Solid-Layer Melt Crystallization

References

Problems

Chapter 19 Introduction to Membrane Separation Processes

19.0 SummaryObjectives

19.1 Membrane Separation Equipment

19.2 Membrane Concepts

19.3 Gas Permeation (GP)

19.3.1 GP of Binary Mixtures

19.3.2 Binary Permeation in Perfectly Mixed Systems

Example 19-1. Well-mixed GPsequential, analytical solution

Example 19-2. Well-mixed GPsimultaneous solutions

19.3.3 Multicomponent Permeation in Perfectly Mixed Systems

Example 19-3. Multicomponent, perfectly mixed GP

19.3.4 Effect of Pores and Holes in Membrane

Example 19-4. Effect of holes

19.4 Osmosis and Reverse Osmosis (RO)

19.4.1 Analysis of Osmosis

19.4.2 Analysis of RO

19.4.3 RO in Well-Mixed Modules

Example 19-5. Determination of RO membrane properties

Example 19-6. RO without concentration polarization

Table of Contents

19.4.4 Mass Transfer Analysis of Concentration Polarization

Example 19-7. RO with concentration polarization

Example 19-8. Prediction of RO performance with concentration polarization

19.4.5 Forward Osmosis (FO)

19.5 Ultrafiltration (UF)

19.5.1 UF Membranes and Basic Equations

19.5.2 Gel Formation in UF

Example 19-9. UF with gel formation

19.5.3 UF Operating Methods

19.5.4 Microfiltration (MF)

Example 19.10. Part I. MF with small particles

Example 19.10. Part II. MF with particles > 1.0 μm

19.5.5 Tricky Units

19.6 Pervaporation

19.6.1 Pervaporation Basics

19.6.2 Pervaporation Design Using Experimental Data

Example 19-11. Part I. Pervapfeasibility calculation

Example 19-11. Part II: Development of a feasible design

19.6.3 Theoretical Analysis and Design of Pervaporation Systems

Example 19-12. Analysis of pervaporation data

19.7 Bulk Flow Pattern Effects

Example 19-13. Flow pattern effects in GP

19.7.1 Binary Crossflow Permeation

19.7.2 Binary Cocurrent and Countercurrent Permeation

References

Problems

Appendix A. Spreadsheet for Crossflow GP

Chapter 20 Introduction to Adsorption, Chromatography, and Ion Exchange

20.0 Summary Objectives

20.1 Adsorbents and Adsorption Equilibrium

20.1.1 Definitions

20.1.2 Adsorbent Types

Table of Contents

20.1.3 Adsorption Equilibrium Behavior

Example 20-1. Adsorption equilibrium

20.2 Solute Movement Analysis for Linear Systems: Basics and Applications to Chromatography

20.2.1 Movement of Solute in a Column

20.2.2 Solute Movement Theory for Linear Isotherms

20.2.3 Application of Linear Solute Movement Theory to Purge Cycles and Elution Chromatography

Example 20-2. Linear solute movement analysis of elution chromatography

20.3 Solute Movement Analysis for Linear Systems: Temperature and Pressure Swing Adsorption and Simulated Moving Beds

20.3.1 Temperature Swing Adsorption

Example 20-3. Thermal regeneration with linear isotherm

20.3.2 Pressure Swing Adsorption

Example 20-4. PSA system

20.3.3 Simulated Moving Beds

Example 20-5. SMB system

20.4 Nonlinear Solute Movement Analysis

20.4.1 Diffuse Waves

Example 20-6. Diffuse wave

20.4.2 Shock Waves

Example 20-7. Self-sharpening shock wave

20.5 Ion Exchange

20.5.1 Ion-Exchange Equilibrium

20.5.2 Movement of Ions

Example 20-8. Ion movement for divalent-monovalent exchange

References

Problems

Chapter 21 Mass Transfer Analysis of Adsorption, Chromatography, and Ion Exchange

21.0 Summary Objectives

21.1 Mass and Energy Transfer in Packed Beds

21.1.1 Mass Transfer and Diffusion

Table of Contents

21.1.2 Column Mass Balances

21.1.3 Lumped Parameter Mass Transfer

21.1.4 Energy Balances and Heat Transfer

21.1.5 Derivation of Solute Movement Theory

21.1.6 Detailed Simulators

21.2 Mass Transfer Solutions for Linear Systems

21.2.1 Lapidus and Amundson Solution for Local Equilibrium with Dispersion in Liquids

21.2.2 Superposition in Linear Systems

Example 21-1. Lapidus and Amundson solution for elution

21.2.3 Linear Chromatography

Example 21-2. Determination of linear isotherm parameters, N , and resolution for linear chromatography

21.3. Nonlinear Systems

21.3.1 Constant Pattern Analysis

Example 21-3. Development of constant pattern solution

Example 21-4. Constant pattern calculation

21.3.2 Length of Unused Bed Approach for Constant Patterns

21.3.3 Scaling LUB and Constant Pattern Systems

Example 21-5. Scaling LUB approach with pore diffusion control

21.3.4 Data Mining Breakthrough Experiments

21.3.5 Review of Proportional Pattern Options

21.4 Checklist for Practical Design and Operation
