

PETER WOOD

Understanding **IMMUNOLOGY**

THIRD EDITION

Understanding Immunology

Understanding Immunology

Table of Contents

Front Cover

Understanding Immunology

Contents

Preface

Acknowledgements

The threat to the body: the role and requirements of the
immune system

The role and complexity of the immune system

Pathogens differ in size, lifestyle and how they cause disease

How do pathogens cause disease and what protection is
there?

Conclusion

Summary

Questions

Further reading

The immediate response to infection: innate immunity and
the inflammatory response

The response to infection

The immediate response to infection the innate immune system

Cytokines hormones of the immune system

The inflammatory response and cell migration

Cell migration through blood and into tissue

Table of Contents

The inflammatory response

Systemic inflammation involvement of the brain and liver

Opsonins can promote phagocytosis

Interferons and natural killer cells

The innate immune response limits the early replication of
pathogens

Summary

Questions

Further reading

Specific immune recognition: B lymphocytes and the antibody molecule

Introduction to the specific immune system

Antibody structure

Recognition by antibody antigens and epitopes

There are different antibody classes with different biological
functions

Antibody can be secreted or expressed on the cell surface of B
lymphocytes

Summary

Questions

Further reading

T lymphocytes and MHC-associated recognition of antigen

There are different types of T lymphocytes

T cells recognise antigen through their T cell receptor (TCR)

The major histocompatibility complex

Recognition of antigen by T cells

Table of Contents

Antigens must be processed before they can be presented
by MHC molecules

Summary

Questions

Further reading

Lymphocyte development and the generation of antigen receptors

The production of lymphocytes: lymphopoiesis

B lymphocytes are produced in the bone marrow

T lymphocytes finish their production in the thymus

During their development lymphocytes must generate huge numbers
of Ig and TCR receptors with different antigen specificities

Developing lymphocytes rearrange their Ig or TCR genes in a
carefully controlled order

Why is there continuous production of lymphocytes, most of which
die?

Summary

Questions

Further reading

Anatomy of the immune system

Requirements of the immune system

Different pathogens require different types of immune responses

The anatomy of the lymphoid system promotes the interaction of
cells and antigen

Lymphocytes continually recirculate through blood, tissues and
lymphatic vessels

Summary

Table of Contents

Questions

Further reading

Anatomical and cellular aspects of antibody production

Overview of antibody production

Activation of CD4 T cells (05 days)

Stimulation of B cells by antigen and interaction with Th (05 days after antigen)

Formation of germinal centres (414 days after antigen)

MALT and the production of IgA

Summary

Questions

Further reading

Effector mechanisms: dealing with pathogens in vivo (1)

Antibody-mediated responses

Humoral and cell-mediated immunity

Antibodies provide protection in many different ways

Neutralisation by antibody

Antibodies can cause agglutination of microbes

Antibodies can act as opsonins and promote phagocytosis

Complement is a protein cascade with antimicrobial functions

Antibody and complement synergise to promote the opsonisation of microbes

Antibody-dependent cell-mediated cytotoxicity (ADCC)

Summary

Questions

Further reading

Effector mechanisms: dealing with pathogens in vivo (2)

Table of Contents

Cell-mediated immunity

Introduction

CD4 T cells develop into different types of helper T cells
during immune responses

CD8 cytotoxic T cells are important in intracellular infections

Delayed-type hypersensitivity and the activation of macrophages

Th2 responses are important against worms

Th17 responses involve high levels of inflammation

Different effector responses have different costs to the host

Summary

Questions

Further reading

Immunological memory and vaccination, the production and use of antibodies

Immunological memory the basis of immunity

Vaccines induce immunity without causing disease

Antibodies can be produced and used in many ways in
treatments and in tests

Summary

Questions

Further reading

Immunological tolerance and regulation why doesn't the immune system attack ourselves?

Immunological tolerance what is it and why do we need it?

Self-tolerance in B cells

Self-tolerance in T lymphocytes selecting for recognition of
self-MHC but not self-antigen

Table of Contents

How do we maintain tolerance to self-antigens not expressed in the thymus?

Summary

Questions

Further reading

Autoimmune diseases

Autoimmune diseases occur when our immune systems attack our own bodies

There are many different autoimmune diseases

Immunological features of autoimmune diseases

Both genetic and environmental factors contribute to the development of autoimmune disease

How is immunological tolerance lost in autoimmune disease?

Summary

Questions

Further reading

Allergy and other hypersensitivities

Introduction

Type I hypersensitivity and allergy

Allergies result in a variety of clinical symptoms

Testing for allergy

Both genetics and the environment contribute to allergy

Why have IgE in the first place?

Treatment of allergy

Type II hypersensitivity

Type III hypersensitivity

Table of Contents

Differences between type II and type III hypersensitivity

Delayed hypersensitivity and contact hypersensitivity

Summary

Questions

Further reading

AIDS

History and incidence of AIDS

The human immunodeficiency virus

Clinical course of HIV infection

Immunological events associated with HIV infection

Chemotherapy can prolong the life of HIV-infected people

HIV has proven very difficult for vaccine development

Summary

Questions

Further reading

Manipulating the immune system:

transplantation and tumours

Introduction

Transplantation: from kidneys to faces

Using the immune system against tumours

Summary

Questions

Further reading

Answers
