EDITION

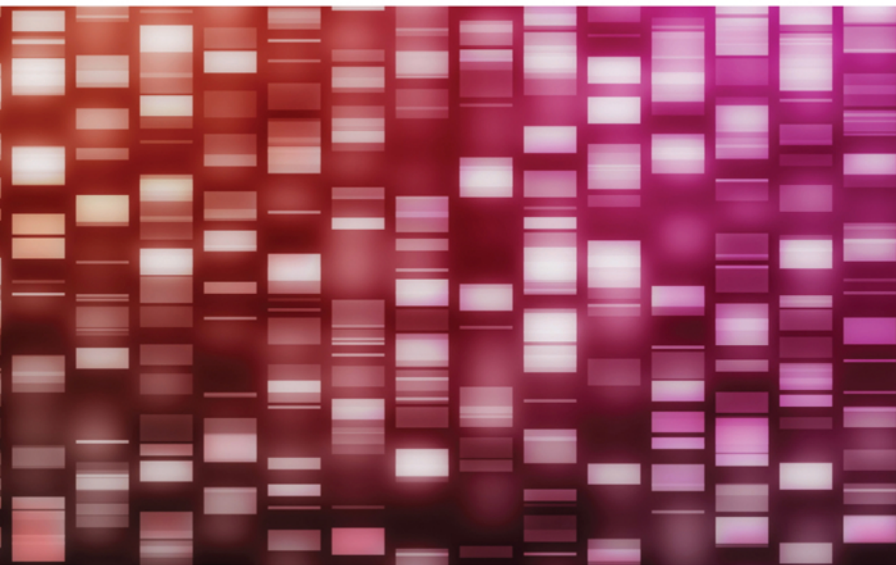

Genetic Analysis

An Integrated Approach

SECOND EDITION

Mark F. Sanders • John L. Bowman

ALWAYS LEARNING

PEARSON

Brief Table of Contents

UNIT I: GENE TRANSMISSION AND FUNCTION

- 1 The Molecular Basis of Heredity, Variation, and Evolution 33
- 2 Transmission Genetics 58
- 3 Cell Division and Chromosome Heredity 96
- 4 Inheritance Patterns of Single Genes and Gene Interaction 136
- 5 Genetic Linkage and Mapping in Eukaryotes 176
- 6 Genetic Analysis and Mapping in Bacteria and Bacteriophages 218

UNIT II: CENTRAL DOGMA

- 7 DNA Structure and Replication 259
- 8 Molecular Biology of Transcription and RNA Processing 299
- 9 The Molecular Biology of Translation 337
- 10 The Integration of Genetic Approaches: Understanding Sickle Cell Disease 370

UNIT III: GENOME STRUCTURE AND FUNCTION

- 11 Chromosome Structure 397
- 12 Gene Mutation, DNA Repair, and Homologous Recombination 423
- 13 Chromosome Aberrations and Transposition 462
- 14 Regulation of Gene Expression in Bacteria and Bacteriophage 500
- 15 Regulation of Gene Expression in Eukaryotes 536

UNIT IV: GENOME EXPRESSION AND ANALYSIS

- 16 Analysis of Gene Function by Forward Genetics and Reverse Genetics 565
- 17 Recombinant DNA Technology and Its Applications 599
- 18 Genomics: Genetics from a Whole-Genome Perspective 643
- 19 Organelle Inheritance and the Evolution of Organelle Genomes 681
- 20 Developmental Genetics 713

UNIT V: GENETIC ANALYSIS OF POPULATIONS

- 21 Genetic Analysis of Quantitative Traits 745
- 22 Population Genetics and Evolution at the Population, Species, and Molecular Levels 774

Genetic Analysis: An Integrated Approach, Global Edition

Table of Contents

Chapter 1 The Molecular Basis of Heredity, Variation, and Evolution

1.1 Modern Genetics Is in Its Second Century

The First Century of Modern Genetics

Genetics Central to Modern Biology

1.2 The Structure of DNA Suggests a Mechanism for Replication

The Discovery of DNA Structure

DNA Nucleotides

DNA Replication

1.3 DNA Transcription and Messenger RNA Translation Express Genes

Genetic Analysis 1.1

Transcription

Experimental Insight 1.1

Translation

Genomes, Proteomes, and -omic Approaches

Genetic Analysis 1.2

1.4 Evolution Has a Molecular Basis

Darwin's Theory of Evolution

Four Evolutionary Processes

Tracing Evolutionary Relationships

Genetic Analysis 1.3

Case Study The Modern Human Family

Summary

Keywords

Problems

Chapter 2 Transmission Genetics

Table of Contents

2.1 Gregor Mendel Discovered the Basic Principles of Genetic Transmission

Mendels Modern Experimental Approach

Five Critical Experimental Innovations

2.2 Monohybrid Crosses Reveal the Segregation of Alleles

Identifying Dominant and Recessive Traits

Evidence of Particulate Inheritance and Rejection of the Blending Theory

Segregation of Alleles

Hypothesis Testing by Test-Cross Analysis

Hypothesis Testing by F₂ Self-Fertilization

2.3 Dihybrid and Trihybrid Crosses Reveal the Independent Assortment of Alleles

Dihybrid-Cross Analysis of Two Genes

Genetic Analysis 2.1

Testing Independent Assortment by Test-Cross Analysis

Genetic Analysis 2.2

Testing Independent Assortment by Trihybrid-Cross Analysis

Probability Calculations in Genetics Problem Solving

The Rediscovery of Mendels Work

Genetic Analysis 2.3

Experimental Insight 2.1

2.4 Probability Theory Predicts Mendelian Ratios

The Product Rule

Experimental Insight 2.2

The Sum Rule

Conditional Probability

Experimental Insight 2.3

Binomial Probability

2.5 Chi-Square Analysis Tests the Fit Between Observed Values and Expected Outcomes

The Normal Distribution

Chi-Square Analysis

Chi-Square Analysis of Mendels Data

2.6 Autosomal Inheritance and Molecular Genetics Parallel the Predictions of Mendels Hereditary Principles

Autosomal Dominant Inheritance

Autosomal Recessive Inheritance

Molecular Genetics of Mendels Traits

Case Study Inheritance of Sickle Cell Disease in Humans

Table of Contents

Summary

Keywords

Problems

Chapter 3 Cell Division and Chromosome Heredity

3.1 Mitosis Divides Somatic Cells

Stages of the Cell Cycle

Substages of M Phase

Chromosome Distribution

Completion of Cell Division

Cell Cycle Checkpoints

Cell Cycle Mutations and Cancer

3.2 Meiosis Produces Gametes for Sexual Reproduction

Meiosis versus Mitosis

Meiosis I

Meiosis II

The Mechanistic Basis of Mendelian Ratios

Segregation in Single-Celled Diploids

3.3 The Chromosome Theory of Heredity Proposes That Genes Are Carried on Chromosomes

Genetic Analysis 3.1

X-Linked Inheritance

Testing the Chromosome Theory of Heredity

3.4 Sex Determination Is Chromosomal and Genetic

Sex Determination in *Drosophila*

Genetic Analysis 3.2

Mammalian Sex Determination

Diversity of Sex Determination

Experimental Insight 3.1

3.5 Human Sex-Linked Transmission Follows Distinct Patterns

Expression of X-Linked Recessive Traits

Genetic Analysis 3.3

X-Linked Dominant Trait Transmission

Y-Linked Inheritance

3.6 Dosage Compensation Equalizes the Expression of Sex-Linked Genes

Case Study The (Degenerative) Evolution of the Mammalian Y Chromosome

Summary

Table of Contents

Keywords

Problems

Chapter 4 Inheritance Patterns of Single Genes and Gene Interaction

4.1 Interactions between Alleles Produce Dominance Relationships

The Molecular Basis of Dominance

Functional Effects of Mutation

Incomplete Dominance

Codominance

Dominance Relationships of ABO Alleles

Allelic Series

Genetic Analysis 4.1

Lethal Alleles

Sex-Limited Traits

Sex-Influenced Traits

Delayed Age of Onset

4.2 Some Genes Produce Variable Phenotypes

Incomplete Penetrance

Variable Expressivity

GeneEnvironment Interactions

Pleiotropic Genes

4.3 Gene Interaction Modifies Mendelian Ratios

Gene Interaction in Pathways

The One GeneOne Enzyme Hypothesis

Genetic Dissection to Investigate Gene Action

Experimental Insight 4.1

Epistasis and Its Results

Genetic Analysis 4.2

4.4 Complementation Analysis Distinguishes Mutations in the Same Gene from Mutations in Different Genes

Genetic Analysis 4.3

Case Study Complementation Groups in a Human Cancer-Prone Disorder

Summary

Keywords

Problems

Chapter 5 Genetic Linkage and Mapping in Eukaryotes

5.1 Linked Genes Do Not Assort Independently

Table of Contents

Indications of Genetic Linkage

The Discovery of Genetic Linkage

Detecting Autosomal Genetic Linkage Through Test-Cross Analysis

Genetic Analysis 5.1

5.2 Genetic Linkage Mapping Is Based on Recombination Frequency Between Genes

The First Genetic Linkage Map

Map Units

Chi-Square Analysis of Genetic Linkage Data

5.3 Three-Point Test-Cross Analysis Maps Genes

Finding the Relative Order of Genes by Three-Point Mapping

Constructing a Three-point Recombination Map

Determining Gamete Frequencies from Genetic Maps

5.4 Recombination Results from Crossing Over

Cytological Evidence of Recombination

Limits of Recombination Along Chromosomes

Recombination Within Genes

Genetic Analysis 5.2

Biological Factors Affecting Accuracy of Genetic Maps

Recombination Is Dominated by Hotspots

Correction of Genetic Map Distances

5.5 Linked Human Genes Are Mapped Using Lod Score Analysis

Allelic Phase

Lod Score Analysis

Experimental Insight 5.1

Genetic Analysis 5.3

5.6 Recombination Affects Evolution and Genetic Diversity

5.7 Genetic Linkage in Haploid Eukaryotes Is Identified by Tetrad Analysis

Analysis of Unordered Tetrads

Ordered Ascus Analysis

5.8 Mitotic Crossover Produces Distinctive Phenotypes

Case Study Mapping the Gene for Cystic Fibrosis

Summary

Keywords

Problems

Chapter 6 Genetic Analysis and Mapping in Bacteria and Bacteriophages

Table of Contents

6.1 Bacteria Transfer Genes by Conjugation

Characteristics of Bacterial Genomes

Conjugation Identified

Research Technique 6.1

Transfer of the F Factor

Formation of an Hfr Chromosome

Hfr Gene Transfer

6.2 Interrupted Mating Analysis Produces Time-of-Entry Maps

Time-of-Entry Mapping Experiments

Consolidation of Hfr Maps

Genetic Analysis 6.1

6.3 Conjugation with F' Strains Produces Partial Diploids

Plasmids and Conjugation in Archaea

6.4 Bacterial Transformation Produces Genetic Recombination

Genetic Analysis 6.2

Steps in Transformation

Mapping by Transformation

6.5 Bacterial Transduction Is Mediated by Bacteriophages

Bacteriophage Life Cycles

Generalized Transduction

Cotransduction

Cotransduction Mapping

Specialized Transduction

6.6 Bacteriophage Chromosomes Are Mapped by Fine-Structure Analysis

Genetic Analysis 6.3

Genetic Complementation Analysis

Intragenic Recombination Analysis

Deletion-Mapping Analysis

6.7 Lateral Gene Transfer Alters Genomes

Lateral Gene Transfer and Genome Evolution

Identifying Lateral Gene Transfer in Genomes

Case Study The Evolution of Antibiotic Resistance and Change in Medical Practice

Summary

Keywords

Problems

Chapter 7 DNA Structure and Replication

Table of Contents

7.1 DNA Is the Hereditary Molecule of Life

Chromosomes Contain DNA

A Transformation Factor Responsible for Heredity

DNA Is the Transformation Factor

DNA Is the Hereditary Molecule

7.2 The DNA Double Helix Consists of Two Complementary and Antiparallel Strands

DNA Nucleotides

Genetic Analysis 7.1

Complementary DNA Nucleotide Pairing

The Twisting Double Helix

7.3 DNA Replication Is Semiconservative and Bidirectional

Three Competing Models of Replication

The Meselson-Stahl Experiment

Origin and Directionality of Replication in Bacterial DNA

Multiple Replication Origins in Eukaryotes

7.4 DNA Replication Precisely Duplicates the Genetic Material

DNA Sequences at Replication Origins

Replication Initiation

Continuous and Discontinuous Strand Replication

RNA Primer Removal and Okazaki Fragment Ligation

Simultaneous Synthesis of Leading and Lagging Strands

DNA Proofreading

Finishing Replication

Genetic Analysis 7.2

Telomeres, Aging, and Cancer

7.5 Molecular Genetic Analytical Methods Make Use of Dna Replication Processes

The Polymerase Chain Reaction

Separation of PCR Products

Dideoxynucleotide DNA Sequencing

New DNA-Sequencing Technologies: Next Generation and Third Generation

Genetic Analysis 7.3

Case Study Use of PCR and DNA Sequencing to Analyze Huntington Disease Mutations

Summary

Keywords

Problems

Table of Contents

Chapter 8 Molecular Biology Of Transcription and RNA Processing

8.1 RNA Transcripts Carry the Messages of Genes

- RNA Nucleotides and Structure
- Identification of Messenger RNA
- RNA Classification

8.2 Bacterial Transcription Is a Four-Stage Process

- Bacterial RNA Polymerase
- Bacterial Promoters
- Transcription Initiation
- Genetic Analysis 8.1
- Transcription Elongation and Termination
- Transcription Termination Mechanisms

8.3 Archaeal and Eukaryotic Transcription Displays Structural Homology and Common Ancestry

- Eukaryotic and Archaeal RNA Polymerases
- Consensus Sequences for Eukaryotic RNA Polymerase II Transcription
- Research Technique 8.1
- Promoter Recognition
- Detecting Promoter Consensus Elements
- Enhancers and Silencers
- RNA Polymerase I Promoters
- RNA Polymerase III Promoters
- Termination in RNA Polymerase I or III Transcription
- Archaeal Transcription

8.4 Post-Transcriptional Processing Modifies RNA Molecules

- Capping 5' mRNA
- Polyadenylation of 3' Pre-mRNA
- The Torpedo Model of Transcription Termination
- Pre-mRNA Intron Splicing
- Splicing Signal Sequences
- Coupling of Pre-mRNA Processing Steps
- Alternative Transcripts of Single Genes
- Control of Alternative Splicing
- Intron Self-Splicing
- Genetic Analysis 8.2
- Ribosomal RNA Processing

Table of Contents

Transfer RNA Processing

Post-Transcriptional RNA Editing

Case Study Sexy Splicing: Alternative mRNA Splicing and Sex Determination in *Drosophila*

Summary

Keywords

Problems

Chapter 9 The Molecular Biology of Translation

9.1 Polypeptides Are Composed of Amino Acid Chains That Are Assembled at Ribosomes

Amino Acid Structure

Polypeptide and Transcript Structure

Ribosome Structures

Research Technique 9.1

A Three-Dimensional View of the Ribosome

9.2 Translation Occurs in Three Phases

Translation Initiation

Polypeptide Elongation

Genetic Analysis 9.1

Translation Termination

9.3 Translation Is Fast and Efficient

The Translational Complex

Translation of Polycistronic mRNA

9.4 The Genetic Code Translates Messenger Rna into Polypeptide

The Genetic Code Displays Third-Base Wobble

Charging Trna Molecules

9.5 Experiments Deciphered the Genetic Code

No Overlap in the Genetic Code

A Triplet Genetic Code

No Gaps in the Genetic Code

Genetic Analysis 9.2

Deciphering the Genetic Code

The (Almost) Universal Genetic Code

Transfer RNAs and Genetic Code Specificity

Genetic Analysis 9.3

9.6 Translation Is Followed by Polypeptide Folding, Processing, and Protein Sorting

Posttranslational Polypeptide Processing

Table of Contents

The Signal Hypothesis
Case Study Antibiotics and Translation Interference
Summary
Keywords
Problems

Chapter 10 The Integration of Genetic Approaches: Understanding Sickle Cell Disease

10.1 An Inherited Hemoglobin Variant Causes Sickle Cell Disease

The First Patient with Sickle Cell Disease
Hemoglobin Structure
Globin Gene Mutations

10.2 Genetic Variation Can Be Detected by Examining DNA, RNA, and Proteins

Gel Electrophoresis
Hemoglobin Peptide Fingerprint Analysis
Identification of DNA Sequence Variation
Genetic Analysis 10.1
Molecular Probes
Electrophoretic Analysis of Sickle Cell Disease
Research Technique 10.1

10.3 Sickle Cell Disease Evolved by Natural Selection in Human Populations

Research Technique 10.2
Genetic Analysis 10.2
Malaria Infection
Heterozygous Advantage
Evolution of BC and BE
Case Study Transmission and Molecular Genetic Analysis of Thalassemia
Summary
Keywords
Problems

Chapter 11 Chromosome Structure

11.1 Viruses Are Infectious Particles Containing Nucleic Acid Genomes

Viral Genomes
Viral Protein Packaging

11.2 Bacterial Chromosomes Are Organized by Proteins

Bacterial Genome Content
Bacterial Chromosome Compaction

Table of Contents

11.3 Eukaryotic Chromosomes Are Organized into Chromatin

Chromatin Compaction

Histone Proteins and Nucleosomes

Higher Order Chromatin Organization and Chromosome Structure

Nucleosome Distribution and Synthesis During Replication

Genetic Analysis 11.1

11.4 Chromatin Compaction Varies Along the Chromosome

Chromosome Shape and Chromosome Karyotypes

In Situ Hybridization

Imaging Chromosome Territory During Interphase

Chromosome Banding

Heterochromatin and Euchromatin

Centromere Structure

Position Effect Variegation: Effect of Chromatin State on Transcription

Genetic Analysis 11.2

11.5 Chromatin Organizes Archaeal Chromosomes

Archaeal Chromosome and Genome Characteristics

Archaeal Histones

Phylogenetic Origins of Histone Proteins

Case Study Fishing for Chromosome Abnormalities in Cancer Cells

Summary

Keywords

Problems

Chapter 12 Gene Mutation, DNA Repair, and Homologous Recombination

12.1 Mutations Are Rare and Occur at Random

Mutation Rates

Determination of Mutation Rate from Genome Sequence Analysis

12.2 Gene Mutations Modify DNA Sequence

Base-Pair Substitution Mutations

Experimental Insight 12.1

Frameshift Mutations

Regulatory Mutations

Forward Mutation and Reversion

12.3 Gene Mutations May Arise from Spontaneous Events

DNA Replication Errors

Genetic Analysis 12.1

Table of Contents

Spontaneous Nucleotide Base Changes

DNA Nucleotide Lesions

12.4 Mutations May Be Induced by Chemicals or Ionizing Radiation

Chemical Mutagens

Radiation-Induced DNA Damage

The Ames Test

12.5 Repair Systems Correct Some DNA Damage

Direct Repair of DNA Damage

Genetic Analysis 12.2

DNA Damage Signaling Systems

DNA Damage Repair Disorders

Experimental Insight 12.2

12.6 Proteins Control Translesion DNA Synthesis and the Repair of Double-Strand Breaks

Translesion DNA Synthesis

Double-Strand Break Repair

12.7 DNA Double-Strand Breaks Initiate Homologous Recombination

The Holliday Model

The Bacterial RecBCD Pathway

The Double-Stranded Break Model of Meiotic Recombination

Holliday Junction Resolution

12.8 Gene Conversion Is Directed Mismatch Repair in Heteroduplex DNA

Case Study Li-Fraumeni Syndrome is Caused by Inheritance of Mutations of p53

Summary

Keywords

Problems

Chapter 13 Chromosome Aberrations and Transposition

13.1 Nondisjunction Leads to Changes in Chromosome Number

Euploidy and Aneuploidy

Chromosome Nondisjunction

Gene Dosage Alteration

Aneuploidy in Humans

Reduced Fertility in Aneuploidy

Mosaicism

Trisomy Rescue and Uniparental Disomy

13.2 Changes in Euploidy Result in Various Kinds of Polyploidy

Table of Contents

Autopolyploidy and Allopolyploidy

Consequences of Polyploidy

Reduced Recessive Homozygosity

Polyploidy and Evolution

13.3 Chromosome Breakage Causes Mutation by Loss, Gain, and Rearrangement of Chromosomes

Partial Chromosome Deletion

Unequal Crossover

Detecting Duplication and Deletion

Deletion Mapping

Genetic Analysis 13.1

Genetic Analysis 13.2

13.4 Chromosome Breakage Leads to Inversion and Translocation of Chromosomes

Chromosome Inversion

Chromosome Translocation

13.5 Transposable Genetic Elements Move Throughout the Genome

The Discovery of Transposition

Experimental Insight 13.1

The Characteristics and Classification of Transposable Elements

Experimental Insight 13.2

13.6 Transposition Modifies Bacterial Genomes

Insertion Sequences

Composite Transposons

13.7 Transposition Modifies Eukaryotic Genomes

Genetic Analysis 13.3

Drosophila P Elements

Retrotransposons

Case Study Human Chromosome Evolution

Summary

Keywords

Problems

Chapter 14 Regulation of Gene Expression in Bacteria and Bacteriophage

14.1 Transcriptional Control of Gene Expression Requires DNA-Protein Interaction

Negative and Positive Control of Transcription

Regulatory DNA-Binding Proteins

Table of Contents

14.2 The lac Operon Is an Inducible Operon System Under Negative and Positive Control

Lactose Metabolism

lac Operon Function

lac Operon Structure

14.3 Mutational Analysis Deciphers Genetic Regulation of the lac Operon

Analysis of Structural Gene Mutations

lac Operon Regulatory Mutations

Molecular Analysis of the lac Operon

Genetic Analysis 14.1

Experimental Insight 14.1

14.4 Transcription from the Tryptophan Operon Is Repressible and Attenuated

Feedback Inhibition of Tryptophan Synthesis

Attenuation of the trp Operon

Attenuation Mutations

Attenuation in Other Amino Acid Operon Systems

Genetic Analysis 14.2

14.5 Bacteria Regulate the Transcription of Stress Response Genes and Translation and Archaea Regulate Transcription in a Bacteria-II

Alternative Sigma Factors and Stress Response

Translational Regulation in Bacteria

Transcriptional Regulation in Archaea

14.6 Antiterminators and Repressors Control Lambda Phage Infection of

The Lambda Phage Genome

Early Gene Transcription

Cro Protein and the Lytic Cycle

The Repressor Protein and Lysogeny

Resumption of the Lytic Cycle Following Lysogeny Induction

Case Study Vibrio Cholerae Stress Response Leads to Serious Infection

Summary

Keywords

Problems

Chapter 15 Regulation of Gene Expression in Eukaryotes

15.1 Cis-Acting Regulatory Sequences Bind Trans-Acting Regulatory Proteins to Control Eukaryotic Transcription

Transcriptional Regulatory Interactions

Table of Contents

Integration and Modularity of Regulatory Sequences
Transcription Regulation by Enhancers and Silencers
Locus Control Regions
Mutations in Regulatory Sequences
Enhancer-sequence Conservation
Yeast Enhancer and Silencer Sequences
Insulator Sequences

15.2 Chromatin Remodeling and Modification Regulates Eukaryotic Transcription

PEV Mutations
Overview of Chromatin Remodeling and Chromatin Modification
Open and Covered Promoters
Mechanisms of Chromatin Remodeling
Chemical Modifications of Chromatin
Genetic Analysis 15.1
An Example of Transcriptional Regulation in *S.cerevisiae*
Epigenetic Heritability
A Role for lncRNAs in Gene Regulation
Inactivation of Eutherian Mammalian Female X Chromosomes
Genomic Imprinting
Nucleotide Methylation

15.3 RNA-Mediated Mechanisms Control Gene Expression

Gene Silencing by Double-Stranded RNA
Chromatin Modification by RNAi
The Evolution and Applications of RNAi
Case Study Environmental Epigenetics
Summary
Keywords
Problems

Chapter 16 Analysis of Gene Function by Forward Genetics and Reverse Genetics

16.1 Forward Genetic Screens Identify Genes by Their Mutant Phenotypes

General Design of Forward Genetic Screens
Specific Strategies of Forward Genetic Screens
Analysis of Mutageneses
Genetic Analysis 16.1
Identifying Interacting and Redundant Genes Using Modifier Screens

Table of Contents

16.2 Genes Identified by Mutant Phenotype Are Cloned Using Recombinant DNA Technology

Cloning Genes by Complementation

Using Transposons to Clone Genes

Positional Cloning

Positional Cloning in Humans: the Huntington Disease Gene

Genome Sequencing to Determine Gene Identification

16.3 Reverse Genetics Investigates Gene Action by Progressing from Gene Identification to Phenotype

Use of Insertion Mutants in Reverse Genetics

RNA Interference in Gene Activity

Reverse Genetics by TILLING

16.4 Transgenes Provide a Means of Dissecting Gene Function

Genetic Analysis 16.2

Monitoring Gene Expression with Reporter Genes

Enhancer Trapping

Investigating Gene Function with Chimeric Genes

Case Study Reverse Genetics and Genetic Redundancy in Flower Development

Summary

Keywords

Problems

Chapter 17 Recombinant DNA Technology and Its Applications

17.1 Specific Dna Sequences Are Identified and Manipulated Using Recombinant Dna Technology

Restriction Enzymes

Experimental Insight 17.1

Genetic Analysis 17.1

Molecular Cloning

DNA Libraries

Sequencing Long DNA Molecules

17.2 Introducing Foreign Genes into Genomes Creates Transgenic Organisms

Expression of Heterologous Genes in Bacterial and Fungal Hosts

Experimental Insight 17.2

Transformation of Plant Genomes by Agrobacterium

Transgenic Animals

Advances in Altering and Synthesizing DNA Molecules

Table of Contents

Manipulation of DNA Sequences in Vivo

Genetic Analysis 17.2

17.3 Gene Therapy Uses Recombinant DNA Technology

Two Forms of Gene Therapy

Gene Therapy in Humans

17.4 Cloning of Plants and Animals Produces Genetically Identical Individuals

Case Study Curing Sickle Cell Disease in Mice

Summary

Keywords

Problems

Chapter 18 Genomics: Genetics from a Whole-genome Perspective

18.1 Structural Genomics Provides a Catalog of Genes in a Genome

Whole-Genome Shotgun Sequencing

The Clone-by-Clone Sequencing Approach

Metagenomics

18.2 Annotation Ascribes Biological Function to Dna Sequences

Experimental Insight 18.1

Variation in Genome Organization Among Species

Three Insights from Genome Sequences

18.3 Evolutionary Genomics Traces the History of Genomes

Research Technique 18.1

The Tree of Life

Interspecific Genome Comparisons: Gene Content

Research Technique 18.2

Genetic Analysis 18.1

Interspecific Genome Comparisons: Genome Annotation

Interspecific Genome Comparisons: Gene Order

Intraspecific Genome Comparisons

Human Genetic Diversity

SNPs and Indels in Humans

Prenatal Genome Sequencing

18.4 Functional Genomics Aids in Elucidating Gene Function

Transcriptomics

Other -omes and -omics

Genomic Approaches to Reverse Genetics

Use of Yeast Mutants to Categorize Genes

Table of Contents

Genetic Networks

Case Study Genomic Analysis of insect Guts May Fuel the World

Summary

Keywords

Problems

Chapter 19 Organelle Inheritance and The Evolution of Organelle Genomes

19.1 Organelle Inheritance Transmits Genes Carried on Organelle Chromosomes

The Discovery of Organelle Inheritance

Homoplasmy and Heteroplasmy

Genome Replication in Organelles

Replicative Segregation of Organelle Genomes

19.2 Modes of Organelle Inheritance Depend on the Organism

Mitochondrial Inheritance in Mammals

Genetic Analysis 19.1

Mating Type and Chloroplast Segregation in *Chlamydomonas*

Biparental Inheritance in *Saccharomyces cerevisiae*

Summary of Organelle Inheritance

19.3 Mitochondria Are the Energy Factories of Eukaryotic Cells

Mitochondrial Genome Structure and Gene Content

Mitochondrial Transcription and Translation

19.4 Chloroplasts Are the Sites of Photosynthesis

Chloroplast Genome Structure and Gene Content

Chloroplast Transcription and Translation

Editing of Chloroplast Mrna

19.5 The Endosymbiosis Theory Explains Mitochondrial and Chloroplast Evolution

Experimental Insight 19.1

Separate Evolution of Mitochondria and Chloroplasts

Continual DNA Transfer from Organelles

Encoding of Organellar Proteins

The Origin of the Eukaryotic Lineage

Secondary and Tertiary Endosymbioses

Case Study Ototoxic Deafness: A Mitochondrial GeneEnvironment Interaction

Summary

Keywords

Table of Contents

Problems

Chapter 20 Developmental Genetics

20.1 Development Is the Building of a Multicellular Organism

Cell Differentiation

Pattern Formation

20.2 Development Is a Paradigm for Animal Development

The Developmental Toolkit of *Drosophila*

Maternal Effects on Pattern Formation

Coordinate Gene Patterning of the Anterior-Posterior Axis

Domains of Gap Gene Expression

Regulation of Pair-Rule Genes

Specification of Parasegments by Hox Genes

Genetic Analysis 20.1

Downstream Targets of Hox Genes

Hot Genes in Metazoans

Stabilization of Cellular Memory by Chromatin Architecture

20.3 Cellular Interactions Specify Cell Fate

Inductive Signaling Between Cells

Lateral Inhibition

Cell Death During Development

20.4 Evolution Behaves Like a Tinkerer

Evolution Through Co-Option

Constraints on Co-Option

20.5 Plants Represent an Independent Experiment in Multicellular Evolution

Development at Meristems

Combinatorial Homeotic Activity in Floral Organ Identity

Genetic Analysis 20.2

Case Study Cyclopia and Polydactyly: Different Shh Mutations with Distinctive Phenotypes

Summary

Keywords

Problems

Chapter 21 Genetic Analysis Of Quantitative Traits

21.1 Quantitative Traits Display Continuous Phenotype Variation

Genetic Potential

Major Genes and Additive Gene Effects

Continuous Phenotypic Variation from Multiple Additive Genes

Table of Contents

Allele Segregation in Quantitative Trait Production
Effects of Environmental Factors on Phenotypic Variation
Threshold Traits

21.2 Quantitative Trait Analysis Is Statistical

Statistical Description of Phenotypic Variation
Genetic Analysis 21.1
Experimental Insight 21.1
Partitioning Phenotypic Variance
Genetic Analysis 21.2
Partitioning Genetic Variance

21.3 Heritability Measures the Genetic Component of Phenotypic Variation

Broad Sense Heritability
Twin Studies
Narrow Sense Heritability and Artificial Selection

21.4 Quantitative Trait Loci Are the Genes That Contribute to Quantitative Traits

QTL Mapping Strategies
Identification of QTL Genes
Genome-Wide Association Studies
Case Study GWAS and Crohns Disease
Summary
Keywords
Problems

Chapter 22 Population Genetics and Evolution at the Population, Species, and Molecular Levels

22.1 The Hardy-Weinberg Equilibrium Describes the Relationship of Allele and Genotype Frequencies in Populations

Populations and Gene Pools
The Hardy-Weinberg Equilibrium
Determining Autosomal Allele Frequencies in Populations
The Hardy-Weinberg Equilibrium for More Than Two Alleles
The Chi-Square Test of Hardy-Weinberg Predictions

22.2 Natural Selection Operates Through Differential Reproductive Fitness Within a Population

Differential Reproduction and Relative Fitness
Genetic Analysis 22.1
Directional Natural Selection

Table of Contents

Natural Selection Favoring Heterozygotes

Convergent Evolution

22.3 Mutation Diversifies Gene Pools

Quantifying the Effects and Reverse Mutation Rates

Mutation/Selection Balance

Genetic Analysis 22.2

22.4 Migration Is Movement of Organisms and Genes Between Populations

Effects of Gene Flow

Allele Frequency Equilibrium and Equalization

22.5 Genetic Drift Causes Allele Frequency Change by Sampling Error

The Founder Effect

Genetic Bottlenecks

22.6 Inbreeding Alters Genotype Frequencies

The Coefficient of Inbreeding

Inbreeding Depression

Genetic Analysis 22.3

22.7 Species and Higher Taxonomic Groups Evolve by the Interplay of Four Evolutionary Processes

Processes of Speciation

Reproductive Isolation and Speciation

Contemporary Evolution in Darwin's Finches

22.8 Molecular Evolution Changes Genes and Genomes Through Time

Vertebrate Steroid Receptor Evolution

Human Genetic Diversity and Evolution

Case Study CODIS Using Population Genetics to Solve Crime and Identify Paternity

Summary

Keywords
