Foreword

Introduction

Chapter 1 Introducing the tabular model

Semantic models in Analysis Services

What is Analysis Services and why should I use it?

A short history of Analysis Services

Understanding Tabular and Multidimensional

The tabular model

The multidimensional model

Why have two models?

The future of Analysis Services

Azure Analysis Services

Choosing the right model for your project

Licensing

Upgrading from previous versions of Analysis Services

Ease of use

# **Table of Contents**

- Compatibility with Power Pivot
- Compatibility with Power BI
- Query performance characteristics
- Processing performance characteristics
- Hardware considerations
- Real-time BI
- Client tools
- Feature comparison

## **Understanding DAX and MDX**

- The DAX language
- The MDX language
- Choosing the query language for Tabular

## **Introduction to Tabular calculation engines**

- Introduction to VertiPaq
- Introduction to DirectQuery

**Tabular model compatibility level (1200 vs. 110x)**

**Analysis Services and Power BI**

**Summary**

## **Chapter 2 Getting started with the tabular model**

### **Setting up a development environment**

- Components of a development environment
- Licensing
- Installation process

### **Working with SQL Server Data Tools**

- Creating a new project
- Configuring a new project
- Importing from Power Pivot
- Importing from Power BI

# **Table of Contents**

Importing a Deployed Project from Analysis Services

Contents of a tabular project

## **Building a simple tabular model**

Loading data into tables

Working in the diagram view

Navigating in Tabular Model Explorer

## **Deploying a tabular model**

## **Querying tabular models with Excel**

Connecting to a tabular model

Using PivotTables

Using slicers

Sorting and filtering rows and columns

Using Excel cube formulas

## **Querying tabular models with Power BI Desktop**

Creating a connection to a tabular model

Building a basic Power BI report

Adding charts and slicers

Interacting with a report

## **Working with SQL Server Management Studio**

Importing from Power Pivot

Importing from Power BI Desktop

Using DAX Studio as an alternative to SSMS

## **Summary**

## **Chapter 3 Loading data inside Tabular**

Understanding data sources

Understanding impersonation

Understanding server-side and client-side credentials

Working with big tables

# **Table of Contents**

## Loading from SQL Server

- Loading from a list of tables

- Loading from a SQL query

- Loading from views

## Opening existing connections

## Loading from Access

## Loading from Analysis Services

- Using the MDX editor

- Loading from a tabular database

## Loading from an Excel file

## Loading from a text file

## Loading from the clipboard

## Loading from a Reporting Services report

- Loading reports by using the report data source

- Loading reports by using data feeds

## Loading from a data feed

## Loading from SharePoint

## Choosing the right data-loading method

## Summary

## Chapter 4 Introducing calculations in DAX

### Introduction to the DAX language

- DAX syntax

- DAX data types

- DAX operators

- Column reference and measures reference

- Aggregate functions

- Table functions

# **Table of Contents**

Evaluation context

CALCULATE and CALCULATETABLE

Variables

Measures

Calculated columns

Calculated tables

Writing queries in DAX

Formatting DAX code

DAX Formatter, DAX Studio, and DAX Editor

Summary

## **Chapter 5 Building hierarchies**

Basic hierarchies

What are hierarchies?

When to build hierarchies

Building hierarchies

Hierarchy design best practices

Hierarchies spanning multiple tables

Natural and unnatural hierarchies

Parent-child hierarchies

What are parent-child hierarchies?

Configuring parent-child hierarchies

Unary operators

Summary

## **Chapter 6 Data modeling in Tabular**

Understanding different data-modeling techniques

Using the OLTP database

Working with dimensional models

# **Table of Contents**

- Working with slowly changing dimensions

- Working with degenerate dimensions

- Using snapshot fact tables

Using views to decouple from the database

Relationship types

- Cardinality of relationships

- Filter propagation in relationships

- Active state of relationships

- Implementing relationships in DAX

Normalization versus denormalization

Calculated tables versus an external ETL

- Circular reference using calculated tables

Summary

## **Chapter 7 Tabular Model Scripting Language (TMSL)**

Defining objects in TMSL

- The Model object

- The DataSource object

- The Table object

- The Relationship object

- The Perspective object

- The Culture object

- The Role object

TMSL commands

- Object operations in TMSL

- Data-refresh and database-management operations in TMSL

- Scripting in TMSL

Summary

## **Chapter 8 The tabular presentation layer**

# **Table of Contents**

Setting metadata for a Date table

Naming, sorting, and formatting

- Naming objects

- Hiding columns and measures

- Organizing measures and columns

- Sorting column data

- Formatting

Perspectives

Power Viewrelated properties

- Default field set

- Table behavior properties

Key performance indicators

Translations

- Creating a translation file

- Writing translated names in a translation file

- Choosing an editor for translation files

- Importing a translation file

- Testing translations using a client tool

- Removing a translation

- Best practices using translations

Selecting culture and collation in a tabular model

- Changing culture and collation using an integrated workspace

- Changing culture and collation using a workspace server

Summary

## **Chapter 9 Using DirectQuery**

Configuring DirectQuery

- Setting DirectQuery in a development environment

- Setting DirectQuery after deployment

# **Table of Contents**

## Limitations in tabular models for DirectQuery

- Supported data sources
- Restrictions for data sources
- Restrictions for data modeling
- Restrictions for DAX formulas
- Restrictions for MDX formulas
- Tuning query limit

## Choosing between DirectQuery and VertiPaq

## Summary

## Chapter 10 Security

### User authentication

- Connecting to Analysis Services from outside a domain
- Kerberos and the double-hop problem

### Roles

- Creating database roles
- Membership of multiple roles

### Administrative security

- Granting permission through the server administrator role
- Granting database roles and administrative permissions

### Data security

- Basic data security
- Testing security roles
- Advanced row-filter expressions
- Security in calculated columns and calculated tables
- Using a permissions table
- Evaluating the impact of data security on performance

### Creating dynamic security

- DAX functions for dynamic security

# **Table of Contents**

Implementing dynamic security by using CUSTOMDATA

Implementing dynamic security by using USERNAME

## **Security in DirectQuery**

Security and impersonation with DirectQuery

Row-level security on SQL Server earlier than 2016

## **Monitoring security**

## **Summary**

# **Chapter 11 Processing and partitioning tabular models**

## **Automating deployment to a production server**

## **Table partitioning**

Defining a partitioning strategy

Defining partitions for a table in a tabular model

Managing partitions for a table

## **Processing options**

Available processing options

Defining a processing strategy

Executing processing

## **Processing automation**

Using TMSL commands

Using SQL Server Integration Services

Using Analysis Management Objects (AMO) and Tabular Object Model (TOM)

Using PowerShell

## **Sample processing scripts**

Processing a database

Processing tables

Processing partitions

Rolling partitions

## **Summary**

# **Table of Contents**

## **Chapter 12 Inside VertiPaq**

### **Understanding VertiPaq structures**

Understanding column storage

Value encoding versus hash encoding

Run-length encoding

Controlling column encoding

Hierarchies and relationships

Segmentation and partitioning

### **Reading VertiPaq internal metadata**

Using DMVs for VertiPaq memory usage

Interpreting VertiPaq Analyzer reports

### **Memory usage in VertiPaq**

Data memory usage

Processing memory usage

Querying memory usage

### **Understanding processing options**

What happens during processing

Available processing options

### **Summary**

## **Chapter 13 Interfacing with Tabular**

### **Introducing the AMO and TOM libraries**

Introducing AMOs

Introducing the TOM

### **Introducing the TMSL commands**

### **Creating a database programmatically**

### **Automating data refresh and partitioning**

### **Analyzing metadata**

# **Table of Contents**

Manipulating a data model

Automating project deployment

- Copying the same database on different servers

- Deploying a model.bim file by choosing a database and server name

Summary

## **Chapter 14 Monitoring and tuning a Tabular service**

Finding the Analysis Services process

Resources consumed by Analysis Services

- CPU

- Memory

- I/O operations

Understanding memory configuration

Using memory-related performance counters

Using dynamic management views

- Interesting DMVs to monitor a Tabular service

Automating monitoring info and logs acquisition

- Performance counters

- SQL Server Profiler

- ASTrace

- Flight Recorder

- Extended Events

- Other commercial tools

Monitoring data refresh (process)

Monitoring queries

Summary

## **Chapter 15 Optimizing tabular models**

Optimizing data memory usage

# **Table of Contents**

Removing unused columns

Reducing dictionary size

Choosing a data type

Reducing a database size by choosing the sort order

Improving encoding and bit sizing

Optimizing large dimensions

## **Designing tabular models for large databases**

Optimizing compression by splitting columns

Optimizing the process time of large tables

Aggregating fact tables at different granularities

## **Designing tabular models for nearreal-time solutions**

Choosing between DirectQuery and VertiPaq

Using partitions

Reducing recalculation time

Managing lock during process

## **Summary**

## **Chapter 16 Choosing hardware and virtualization**

### **Hardware sizing**

CPU clock and model

Memory speed and size

NUMA architecture

Disk and I/O

Hardware requirements for DirectQuery

### **Optimizing hardware configuration**

Power settings

Hyper-threading

NUMA settings

### **Virtualization**

# **Table of Contents**

Splitting NUMA nodes on different VMs

Committing memory to VMs

Scalability of an SSAS Tabular solution

Scalability for a single database (large size)

Scalability for large user workload

Summary
